Even of those physicians claiming Worcester as a home it will be manifestly impossible to mention all. An attempt will be made to give attainable particulars of the leading men only.

1807.—JOHN GREEN, M.D., A.B. (Brown, 1804), born in Worcester, April 19, 1784, who began practice in 1807, less than a year before the death of Dr. John Green, his father, and but eight years after that of the Revolutionary Dr. John Green, his grandfather, is destined to be longer remembered than either; for, with that enduring monument, a public library, his name will always be associated. Having early decided to devote a liberal portion of his fortune to the founding of such an institution, he was, for many years, personally engaged in collecting books, which, in 1859, he presented to the city, adding continually

to the number afterwards, and leaving, by will, thirty thousand dollars as a fund for further increase. He studied medicine with his father, succeeded on the latter's sudden death to his large practice, and continued for more than half a century the recognized leader of the profession in the county. Prudent and cautious almost to a fault, he is said to have realized Thomas Fuller's idea of the "good physician": "He hannels not his new experiments on the bodies of his patients, letting loose mad receipts into the sick man's body to try how well nature in him will fight against them, while himself stands by and sees the battle."

Holding no public office, and devoting himself entirely to his profession, few men were better known than Dr. John Green. "His name," says Judge Thomas, "was a household word. Not to have seen him, as, under that brown, broad-brimmed soft hat, he rolled from side to side, in that old time-honored gig, through the streets of the village, town and city, was to have missed one of the most striking institutions of Worcester."

His personal appearance, at least in old age, is well-known to all frequenters of the "Green library," where statue and picture well represent his slight and stooping figure and intelligent features. His modesty was such that he wished this statue removed, as it seemed to him to suggest a "kind of arrogance" that he did not feel. His manner was quiet; his tastes simple; he cared nothing for display.

In 1815 he was granted the degree of M.D. by Harvard College, and in 1826 Brown followed the example of her sister university. Of the district medical society he was three years treasurer, seven librarian, five vice-president, and seven president, when he declined further service. He was vice-president of the American Medical Society in 1854. He was the first president of the Horticultural Society, councillor of the Massachusetts Medical and of the American Antiquarian Societies, and an early and constant patron of the Natural History Society. Feeble health and increasing age compelled him to retire from active practice about ten years before his death, which took place after several weeks' illness, October 17, 1865, he being then in his eighty-second year. Early in life he married Dolly, daughter of David Curtis, but survived her many years. He left no children, and was the last of the line of doctors of his name<sup>1</sup> that, for more than one hundred years, had been largely responsible for the health of the inhabitants of Worcester.

1808.—DR. BENJAMIN CHAPIN, son of Captain Thaddeus Chapin, was born in Worcester, May 29, 1781. He studied medicine with the second Dr. Green, practised in Marlborough until 1808, when he returned to Worcester, and remained here until his death, January 15, 1835, at the age of fifty-four. His

<sup>1</sup> His nephew, John Green, is a distinguished ophthalmologist in St. Louis, Missouri.

*George Chandler*

office and drug-store stood at the corner of Front and Carlton Streets. He was town clerk from 1818-1833 and in 1830 a member of the Legislature.

1815.—BENJAMIN F. HEYWOOD, M.D., A.B. (Dartmouth, 1812), son of Hon. Benjamin Heywood, a graduate of Harvard College, officer in the Revolutionary army, and judge of the Court of Common Pleas, was born in Worcester, April 24, 1792. He attended lectures at the medical schools of Dartmouth and Yale, graduated from the latter in 1815, and began practice in Worcester immediately afterwards. For more than fifty years he was in active business, twenty of them in partnership with his brother-in-law, Dr. Green, and, at the time of his sudden death, December 7, 1869, at the age of seventy-seven, was the oldest physician in Worcester, and had been longest in practice. A permanent member of the American Medical Association, he held in turn, and for long periods of time, all the offices in the gift of the District Society, and was for many years councillor in the State Society. He was for forty years a trustee of the Worcester County Institution for Savings, and was a director of the Worcester Bank, of which his father was one of the founders. In 1848 he served one term in the Common Council, and from 1848-1856 was a member of the Board of Aldermen. In 1859 he became, by right of his father, a member of the Society of the Cincinnati. His first wife, sister of Dr. John Green, died Aug. 4, 1836; his second wife, also a sister of Dr. Green, still lives in this city.

1826.—O. H. BLOOD, M.D., A.B. (Harvard, 1821), was the son of Gen. T. H. Blood, of Sterling. He studied medicine with Dr. Lemuel Capen, of that place, and attended lectures at the Harvard Medical School, where he graduated in 1826. He practised in Worcester until 1828, when he went to Brookfield. In 1831 he returned, but soon turned his attention to dentistry, in which business he continued until his death, April 8, 1858, at the age of fifty-seven. His wife, now living, is a sister of Mr. H. G. O. Blake.

1829.—JOHN S. BUTLER, M.D., A.B. (Yale, 1825), is a son of Daniel Butler, of Northampton, where he was born October 12, 1803. From 1825-28 he attended lectures in Boston and Philadelphia, and after receiving his degree spent one more year in study, finally opening his office in Worcester in 1829. Early in his career he became interested in the subject of insanity, and, as he himself says, was "a frequent visitor to the newly-established Insane Asylum, and a careful observer in its wards." In 1839 he was appointed resident medical officer of penal, charitable and reformatory institutions, and superintendent of the Insane Asylum of Boston, where he remained until 1842. In 1843 he became superintendent of the Hartford Retreat, which position he resigned in 1873, after nearly thirty years' service. He resides in Hartford; is a member of the State Board of Health, of the American Academy and of the Medico-Psychological Society of Great Britain. From 1870-73 he was

president of the Association of Superintendents of American Insane Asylums.

1831.—GEORGE CHANDLER, M.D., A.B. (Union, 1829), son of Major John W. Chandler, was born in Pomfret, Conn., April 8, 1806. He attended the academies of Dudley and Leicester, spent two years at Brown University and graduated at Union College, Schenectady, N. Y., in 1829. He read medicine with Dr. Holt, of Pomfret, attended lectures in Boston and New Haven, and received his medical degree from Yale College in 1831. The same year he opened an office in Worcester. For part of one year he was in practice in Auburn, and in March, 1833, became Dr. S. B. Woodward's assistant at the Lunatic Hospital. In 1842 he was appointed superintendent of the New Hampshire State Lunatic Asylum, at Concord, erected after the plans submitted by himself. Three years later he resigned this position against the expressed wish of the trustees, and the next year (1846) succeeded Dr. Woodward as superintendent of the Worcester Hospital. This institution was successfully managed by him for ten years, when he gave up his charge and at the same time retired from practice, having devoted twenty-five years to care of the insane. Dr. Chandler has been a member of the Massachusetts, New Hampshire and Connecticut State Medical Societies. In 1859 he represented Ward 8 in the Legislature, and in 1862 was a member of the Board of Aldermen. He is a member of the Antiquarian and Worcester Fire Societies and has devoted much time to the voluminous "Chandler family records." In 1862 he responded to the call for volunteer surgeons, went to Fortress Monroe and returned in medical charge of a transport. His first wife, Josephine Rose, who died in 1868, was a granddaughter of Dr. Wm. Paine. He married, April 8, 1874, Mary E. Douglass, widow of Charles A. Wheeler.

1831.—DR. JOHN PARK, A.B. (Dartmouth, 1791), although never in active practice, resided here for many years. He was born in Windham, N. H., in 1775. From 1793 to 1801 he served in the West Indies, at first as surgeon in the English service and later in the United States Navy. He settled in Newburyport and later moved to Boston, retired from practice, and, in 1811, opened the Boston Lyceum for young ladies, which he successfully managed for twenty years. From 1831 to his death, in 1852, he was in Worcester. He was a member of the Antiquarian Society, to which he presented the greater part of his library. A daughter was the wife of the late Benjamin F. Thomas. Another became the second wife of Rev. Dr. E. B. Hall, of Providence, R. I., father of Rev. Edward H. Hall, who from 1869-82 was the pastor of the Second (Unitarian) Church.

1833.—SAMUEL B. WOODWARD, M.D., son of Dr. Samuel Woodward,<sup>1</sup> himself a physician of ability,

<sup>1</sup> Dr. Samuel Woodward was in practice in Torrington for nearly sixty years. He was distinguished not only in his profession, but in

was born in Torrington, Conn., June 10, 1787. He studied medicine with his father, and, having been licensed to practice by the Connecticut State Medical Society in 1809, assisted him for a year or more, and then removed to Wethersfield, near Hartford. Here he remained twenty-two years, for a large part of the time the only physician in the place. During this period he was elected secretary of the Connecticut Medical Society; vice-president of the Hopkins Medical Society, and one of the medical examiners of Yale College, from which, in 1822, he received the degree of M.D. From 1827-33 he was physician to the Connecticut State Prison. He became early interested in the subject of insanity, and, in 1824, was strongly urged for the position of superintendent of the Bloomingdale Asylum, then opened in the State of New York. He was largely instrumental in the establishment of the Hartford Retreat for the Insane, traveling over the greater part of the State of Connecticut in his doctor's gig, explaining its necessity and soliciting funds. Some negotiations took place for his taking charge of this institution, but he used his influence in favor of his friend, Dr. Eli Todd, who was appointed. On the latter's death, in 1834, the position was again offered him, and in 1840 the offer was repeated, with the promise of a home outside the hospital walls. These offers, as well as a similar one, in 1842, from the trustees of the then new asylum in Utica, N. Y., were declined; but while in Wethersfield he served on the Board of Visitors of the Hartford institution, and "devoted to its prosperity the weight of his personal exertions and influence." In 1832 came the call to take charge of the asylum then in process of erection in Worcester, which call he accepted, came here in 1833, and remained almost without rest for fourteen years. In 1846, with shattered health, he retired to Northampton, where he died January 3, 1850, at the age of fifty-three. Dr. Woodward was an honorary member of the Massachusetts Medical Society from 1833, and of the Connecticut State Society from 1835. In 1832 he represented the Hartford district in the State Senate, his object in accepting the position being the furtherance, by legislation, of the interests of the insane, whose acknowledged champion he already was. In 1838 he became a fellow of the Albany Medical College. He was the first president of the Association of Insane Asylum Superintendents and the founder of the society; a member of the Ohio State Medical Society and Ohio Historical Society. He wrote much for medical and other scientific journals, and, from 1828-43, delivered occasional lectures on temperance and education throughout Connecticut and Massachusetts. Of the Massachusetts School for Idiotic Youth he was a firm friend, and, as early as 1840, had pre-

political life; was for twenty years a member of the Legislature, and from 1800-10 Democratic candidate for Congress. He died January 26, 1850, aged eighty-four. Of his six sons four studied medicine, and all were in practice in Connecticut at one and the same time.

pared a plan for an asylum for inebriates, of which he would willingly have been superintendent. The times were, however, not ripe; the plan was considered chimerical and the project abandoned. An authority on the subject of insanity, and occupying the position of a reformer in its treatment, his private correspondence shows that his opinion was sought by physicians of reputation, not only in this State, but throughout America. Dr. Edward Jarvis, in 1842, calls him "the leader in the great reform in the management of the insane," and says that the example of the hospital and its reports "have done more than any other thing to extend this reformation throughout the Union." Personally popular, on his removal to Worcester six hundred and seventy of the inhabitants of Wethersfield signed a memorial of their regard for his person, respect for his talents and regret at his removal; and, after his departure for Northampton, his bust was placed in the corridor of the Lunatic Hospital by the people of Worcester, while the trustees individually subscribed for the portrait now at the asylum. Six feet two and one-half inches in height, and weighing two hundred and sixty pounds, Dr. Woodward commanded attention wherever he appeared. Of his personal appearance, Mr. Stanton, in his reminiscences, says: "I boarded in Boston at the United States Hotel. Whenever he visited the city, Dr. Samuel B. Woodward, principal of the Insane Asylum at Worcester, dined there. As he walked, erect and majestic, through the long room to the head of the table, every knife and fork rested and all eyes centred on him. He received similar notice when appearing as an expert in the courts. The reason was this: young men who saw George Washington after he passed middle life traced the very close resemblance between him and Dr. Woodward."

1834.—AARON G. BABCOCK, M.D., son of Amos Babcock, of Princeton, where he studied medicine with Dr. Chandler Smith, graduated at the Bowdoin Medical School in 1830. For four years he practised medicine in Holden, then came to Worcester, where he was at first physician, and later physician and druggist. From his drug-store was developed the present extensive establishment of Jerome Marble & Co.

1835.—WILLIAM WORKMAN, M.D., was born in Colrairie, Mass., in 1798, and was fitted for college at Hopkins Academy, in old Hadley. His health failed, he was unable to graduate and was twenty-four years of age before he began to study medicine. After a three years' course with Drs. Washburn, of Greenfield, Flint & Mather, of Northampton, and at the Harvard Medical School, he received his degree in 1825, and immediately opened an office in Shrewsbury. In 1835 he came to Worcester and continued in active practice until 1869, when, at the age of seventy-one, he retired. He died sixteen years later (October 17, 1885), at the age of eighty-seven. Dr. Workman was a member of the American Medical Association, and

for twenty-four years councillor of the Massachusetts Medical Society. In 1854 he delivered the annual address before that body, it being the second time that the honor had been conferred upon a Worcester physician. In 1862, requested to send out surgeons to care for the wounded of the "Seven Days' Fight," he attended to that duty, and although in his sixty-fourth year, went himself to the front. He was connected with the School Board of town and city from 1840 to 1859, was president of the Worcester Lyceum, and from 1862 to '72 trustee of the Worcester Lunatic Hospital. He married, in 1828, Sarah P. Hemenway. His son, William H. Workman, M.D., was in practice here from 1873 to '87.

1836.—JOHN A. ANDREWS, M.D., who is the oldest physician in the city, was born in Hopkinton, September 30, 1802, and has been fifty-two years in practice here. In 1850 and '51 he was connected with the Worcester Medical Institution.

1836.—CHANDLER SMITH, M.D., born in Peru, Berkshire County, in 1803, graduated at the Berkshire Medical School in 1825, and for ten years practised in Princeton. From 1836 until his death—June 28, 1843—he lived in Worcester, and for four years of the time was town physician. He was a trustee of the Worcester Manual Labor High School.

1840.—JOSEPH SARGENT, M.D., A.B. (Harvard, 1834), son of Colonel Henry Sargent, was born in Leicester, December 31, 1815. He studied medicine one year with Dr. Edward Flint, of Leicester, and three at a private school in Boston, of which Dr. James Jackson was the head, attending lectures at the medical schools of Harvard University and in Philadelphia. After receiving his degree of M.D. from Harvard, in 1837, he spent one year as house-officer in the Massachusetts General Hospital, and two years in study in Paris, and in 1840 opened an office in Worcester. In 1850 he spent another year in study in Europe, and visited it again in 1868.

For forty-eight years Dr. Sargent has been a leader in the medical profession. Holding, in turn, all the offices in the District Society, he was councillor in the State Society for a long time, and in 1874-76 vice-president. He was one of the original members of the Boston Society for Medical Observation, and the first out-of-town member of the Boston Society for Medical Improvement. He founded the Worcester Medical Improvement Society. To his exertions is largely due the present prosperity of the City Hospital of which he was trustee from 1871 to 1886, serving at the same time as a member of the consulting staff. From 1843 to 1848 he was a trustee of the Worcester Lunatic Hospital, and is at present, and has always been, a trustee of the Memorial Hospital and Dispensary. He has been medical director of the State Mutual Life Insurance Company since 1844. At his suggestion gas was introduced into Worcester, and he is president of the Worcester Gas Company. He is a

trustee of Clark University. He married Emily Whitney September 27, 1841.

[The death of Dr. Sargent, on October 13, 1888, since the above sketch was prepared, makes it proper here to add a few words. It is impossible, however, within the limits imposed upon us, to do justice to the character and position of the doctor. He brought to Worcester a store of knowledge and skill, which made him pre-eminently the most conspicuous member of the profession in Central Massachusetts, and which would have secured for him fame and success in whatever field of practice he should have selected anywhere. This position he maintained throughout his lifetime. He was, at the same time, a public-spirited citizen, and his services to leading local institutions, as well as to the body politic, were of the highest value. The natural refinement of his character served to elevate the tone of any circle or any business interest with which he was connected. A more full acquaintance with the life of Dr. Sargent may be obtained from the biographical sketches and the proceedings of the various bodies with which he was connected, which appeared in the Worcester *Spy* and *Evening Gazette* immediately following his death, and also from the printed "Proceedings of the American Antiquarian Society," at their meeting on October 22, 1888.—C.]

1840.—CALVIN NEWTON, M.D., was born in Southboro' in 1801, and was educated for the ministry. For a number of years he was settled over a church in Great Barrington, and was later Professor of Rhetoric and Hebrew in Waterville College, Waterville, Maine. Deciding to study medicine, he attended lectures at the Berkshire Medical School, where he graduated in 1840. He immediately opened an office in Worcester. In 1846 he established a medical journal, known as the *N. E. Medical Eclectic*, and later as the *Worcester Journal of Medicine*. This he continued to edit until his death. He lectured to classes of students, and devoted all his energies to the establishment of a school which should raise the standard of practice of those persons known as eclectic or botanic physicians. In this he succeeded, against great opposition, but wore himself out in the attempt, and died in August, 1853, aged fifty-two. He was president of the Worcester Medical Institution and Professor of Pathology. He was, also, in 1852, president of the National Eclectic Medical Society.

1845.—BENJAMIN HEYWOOD, M.D., A.B. (Harvard, 1840), son of Dr. Benjamin F. Heywood, was born in Worcester, July 16, 1821. He studied medicine four years at the University of Pennsylvania, graduated in 1844, and after one year spent in study in Europe, came to Worcester, where his ability was soon recognized, both by the profession and the community. He practised medicine here for fifteen years; was from 1847-54 secretary, treasurer and librarian of the District Society, and in 1859, surgeon of the Tenth Regiment of Militia. He died July 21, 1860, aged thirty-nine.

1845.—RUFUS WOODWARD, M.D., A.B. (Harvard, 1841), was the son of Dr. Samuel B. Woodward, and born in Wethersfield, Connecticut, October 3, 1819. He was fitted in the Worcester schools for Harvard College, which he entered in 1837. After graduation he began the study of medicine with Dr. Joseph Sargent, and in 1842 entered the Harvard Medical School, where he graduated three years later. For three years he was assistant physician at the State Lunatic Hospital, and then spent two years in study in Europe, devoting much time to the subject of insanity, with the intention of assisting his father in a private asylum for mental diseases in Northampton. His plans were changed by the latter's sudden death, in 1850, and on his return to this country, soon after, he established himself in general practice in Worcester. For thirty-three years he devoted himself to his profession, seeing patients on the very day of his own sudden death, December 30, 1885, at the age of sixty-six. A member of local and State Medical Societies, he was, during the war of 1861–65, examining surgeon for volunteers, and in 1862 volunteer surgeon under the Sanitary Commission. From 1863–66 he was city physician, and on the formation of the Board of Health, in 1877 was induced to again accept this position, which he held at the time of his death, being also chairman of the board, of which he was *ex-officio* a member. From 1871–1880 he was visiting surgeon to the City Hospital, consulting surgeon to the Washburn Dispensary from 1874 until his death, and was also physician to the House of Correction, and to the Orphans Home. For twelve years he was a member of the School Board, and from 1861 a member of the Antiquarian Society. In natural history and botany he was always greatly interested; he was, in college, a member of the Harvard Natural History Society, and was one of the founders and for many years president of the local society. Much of his spare time was spent in his garden, and that wild flower whose haunts, in the neighborhood of Worcester, he did not know, was rare indeed.

1845.—SAMUEL F. GREEN, M.D., a grandson of the first Dr. John Green, was born here October 10, 1822; studied medicine with Dr. McVicker, in New York, graduated from the College of Physicians and Surgeons in 1845, and immediately settled in Worcester. A year later he became physician to the American Board, and went to Ceylon. Learning the Tamil language, he established a college for the education of young men in European medicine and surgery. For twenty-one years he lived there, teaching, attending to an extensive practice, and at the same time performing the tremendous task of editing, in Tamil, a complete set of works on medicine. His health was undermined by the climate; he was obliged to return to America, and the last years of his life were spent in Worcester. Wishing to continue his work, the manuscript was, for a long time, prepared here, sent to India, and the proofs in Tamil returned for revision

and correction. He completed text-books on Obstetrics, Surgery, Anatomy, Physiology, Physics and Chemistry, and parts of works on the Pharmacopœia of India, and Medical Jurisprudence—in all three thousand six hundred pages. Many of these are standard in India, and a small annual appropriation to assist in defraying the expense of preparing them was allowed him by the English Government. He died in the Green Hill house, May 28, 1884.

1845.—GEORGE A. BATES, M.D., son of Dr. Anson Bates, of Barre, where he was born in 1820, studied medicine with his brother, Dr. Joseph N. Bates, in that town, and with Dr. N. S. Perry, of Boston, attending also lectures at the Berkshire and Harvard Medical Schools. He graduated from the latter in 1844, and began practice in Barre. In 1845 he came to Worcester, where, with one interval of five years, he remained until his sudden death, August 9, 1885. In 1856 he removed to Washington, D. C., returning in 1861, when his brother left Worcester as surgeon of the Fifteenth Regiment. From 1844 he was a member of the Massachusetts Medical Society; from 1871–83 surgeon at the City Hospital, and, at the time of his death, surgeon of the Worcester Continentals. Never married, he almost lived in his office, where he surrounded himself with old furniture and curiosities of every description. In fact, so great was the accumulation that many were, of necessity, packed away and unearthed only after his death.

1845.—SAMUEL FLAGG, M.D., A.B. (Dartmouth, 1841), son of Samuel Flagg, was born in Worcester July 16, 1821. He studied medicine with Dr. Amos Twitchell, in Keene, N. H., and at the University of Pennsylvania, where he graduated in 1845. In practice in Worcester until 1861; he was from 1852 connected with the militia, at first as assistant surgeon of the Eighth Regiment, and later as surgeon of the Third Battalion of Rifles. He went to the front in 1861 as hospital steward in the Twenty-fifth Regiment, and in 1862 was commissioned assistant surgeon. For two years he was on detail duty in various hospitals and forts in North Carolina. In 1863 he resigned on account of ill health, but soon after went as contract surgeon to the Government Hospital on Long Island, Boston Harbor, remaining there and at Galloupes Island until 1865. Since 1881 he has lived in his cottage on the shores of Lake Quinsigamond. From 1867–69 he was surgeon of the Tenth Regiment Massachusetts Volunteer Militia, and from 1869–77 surgeon and medical director of the Third Brigade.

1845.—WORCESTER SOCIETY FOR MEDICAL IMPROVEMENT, organized for "medical improvement and the cultivation of good-fellowship." It was discontinued in 1846, revived in 1857, and continued until 1874. In 1876 it was re-organized, and until 1886 meetings were held every alternate Wednesday evening, from September to June, at the house of members in turn. Each member was chairman of his own

meeting and read a paper on some scientific subject. There were usually about twenty medical men connected with the society. Its meetings are for the present suspended.

1846.—R. L. HAWES, M.D., was born in Leominster, March 22, 1823. After graduating at the Harvard Medical School (1845), where he took high rank, he began practice in Worcester; but, having invented a machine for folding envelopes, soon turned his attention to business. He died in travelling in Europe in 1867.

1846.—ARMET B. DELAND, in practice here for forty-three years, was born in Brookfield in 1823. He studied medicine with Dr. George Bates and attended lectures at Pittsfield, Mass., Castleton, Vt., and Charleston, S. C.

1847.—HENRY SARGENT, M.D., A.B. (Yale, 1841), son of Colonel Henry Sargent, was born in Leicester, November 7, 1821. His medical studies were pursued with his brother, Dr. Joseph Sargent, with Drs. Bowditch, of Boston, and Gerhardt, of Philadelphia, and at the Harvard Medical School, from which he graduated in 1847, having previously spent two years in Europe, largely in the hospitals of Paris. His health was never good after 1844, when he was poisoned at an autopsy, and he was repeatedly obliged to withdraw from business, visiting Europe in 1851 and again in 1854. With these exceptions, he was in practice in Worcester from the time of his graduation until his death, April 26, 1858, at the age of thirty-six. He was highly esteemed by the profession in Worcester, and to an unusual degree beloved by the community. His wife was Catherine Whitney, to whom he was married in May, 1849. She died in September of the same year.

1848.—PIERRE B. MIGNAULT (of Acadian ancestry) was born in the parish of Chambly, Province of Quebec, August 28, 1818. He became involved in the "Rebellion of '37," and was forced to flee the country. He reached the frontier after various adventures, worked his way to Burlington and later to Boston, and entered the Harvard Medical School, where he graduated in 1846. For two years he practised in Boston, and then came to Worcester, where he remained until 1871, living on Trumbull Square. He now resides in Montreal. In Worcester he was widely known as "The French doctor," and was largely interested in the Sisters' Hospital.

1848.—MERRICK BEMIS, M.D., was born in Sturbridge, Mass., in 1820; studied medicine with Drs. Gilmore, of Brookfield, and Winslow Lewis, of Boston, and received his degree from the Castleton (Vt.) Medical School in 1848. For eight years he was assistant to Dr. Chandler, at the Lunatic Hospital, and in 1856 succeeded him as superintendent. In 1872 he resigned the position and established the private asylum known as Herbert Hall. A member of various medical societies, Dr. Bemis is president of the Worcester Medical Association. During the War

of 1861-65 he did much to encourage recruiting. He has served on the School Committee and in 1860 was a member of the Board of Aldermen. For years he has been prominently identified with the Natural History Society.

1850.—ORAMEL MARTIN, M.D., was born in Hoo-sick, N. Y., July 21, 1810. He attended lectures at the medical schools of Pittsfield, Mass., and Castleton, Vt., from 1829 to 1832, receiving diplomas from both places. In 1833 he began practice in New Braintree. The years 1845-46 he spent in study in the hospitals of Paris. Returning, he practised two years in North Brookfield and two in Hopkinton, and in 1850 removed to Worcester, where he has since remained. "He participated largely in the Anti-Slavery movement and in the formation of the Republican party." In 1861 he went to the front as surgeon of the Third Battalion of Rifles. In August of the same year he was commissioned brigade surgeon by President Lincoln. Invalided after four months' service at Fort McHenry, he no sooner recovered his health than he went to Missouri on General Hunter's staff, and was placed in charge of the hospital village of Otterville, with twelve hundred patients. He was then sent to Kansas, and, after the battle of Pittsburgh Landing, was placed in charge of the Pacific Hospital in St. Louis. Later he was on General Granger's staff in Mississippi, but his health again gave out, and he was obliged to send in his resignation in June, 1862. Until the end of the war he was surgeon of the Board of Enrollment. From 1862 he was also examiner of pensioners; at first alone, and afterwards as one of a board of three, until 1886, when, with one of his colleagues, Dr. J. M. Rice, he was, for political reasons, removed. He is a member of the American Medical Society and of the Massachusetts and Vermont State Societies. He was surgeon of the City Hospital until 1882, and is now a member of the consulting staff. He is also consulting physician to the Washburn Dispensary.

1850.—DEAN TOWNE, M.D., born in Windsor, Vt. February 7, 1810; studied medicine in Woodstock, Vt., and graduated at Castleton in 1833. He practiced twelve years in Windsor, Vt., six years in Shrewsbury, and has, since 1850, been in Worcester. He practically retired from business many years ago.

1851.—HENRY CLARKE, M.D., was the son of Benjamin Clarke, a prosperous farmer of Marlboro', Mass., where he was born October 3, 1824. Spending some years at the academies of Marlboro' and Leicester, he began his professional studies in the office of Dr. Henry Sargent in 1847. In 1848 he entered the Harvard Medical School, where he distinguished himself and received the Boylston prize. He graduated in 1850, and, after a year spent in the hospitals of Paris and Vienna, began practice in Worcester in 1851. To his practice he devoted himself with a zeal and industry that often overtaxed his physical strength, never very robust, and, in 1861, in 1867, and again in

1876, he went to Europe for rest and study. In 1862 he was, for some months, at the front as volunteer surgeon. He was city physician for several of his first years in Worcester; a member of the School Board, and, for fourteen years, physician to the county jail. He was one of the original trustees of the Memorial Hospital under Mr. Washburn's will, and surgeon at the City Hospital from the beginning. He died after a short illness, April 17, 1880, aged fifty-five years. Though at his death he had barely passed middle life, and in aspect and manner younger than his years, he stood in the very first rank of Massachusetts physicians. As a surgeon he was remarkably bold and skillful, and his services were often in demand for difficult cases. Working long after he should have rested, he died "in harness," and prematurely, for his patients—to him his world.

1851.—SETH ROGERS, M.D., born in Danby, Vt., February 13, 1823; graduated in medicine at Castleton in 1849. He had been previously assistant to Dr. Joel Shew, and was, for two years more, with him in a "hydropathic" establishment in New York City. In 1851 he came to Worcester, and established the Worcester Water Cure, which he maintained for some thirteen years. He gave lectures at the Worcester Medical Institution on hydro-therapeutics in 1850 and 1851, and from 1852 to 1854 studied in Paris, leaving Dr. George Hoyt in charge of the hospital here. In 1858 his health failed, and he spent a year in Brazil and France. From 1859 to 1862 he was again in Worcester. In 1862 he joined Colonel T. W. Higginson in South Carolina, and was for a year surgeon of the First Regiment South Carolina (Colored) Volunteers. In 1864 he left Worcester permanently, expecting to live but a short time, but is now in Pomfret, Ct., where, since 1883, he has received at his house patients suffering from chronic disease. In 1867, and later, he was in practice in Florida in the winter. In Worcester he was in general practice, and while using water extensively, was not a "hydropathist."

1851.—ALBIN J. EATON, M.D., was born in Ashburnham June 19, 1809; graduated at the school in Pittsfield in 1836, and was in practice in various places in Massachusetts (among others, in Oakham) until 1851, when he came to Worcester. In 1855 he entirely withdrew from the profession.

1852.—F. H. KELLEY, M.D., was born in New Hampton, N. H., September 9, 1827. He began the study of medicine in Dover in 1847; attended lectures in Cincinnati, Ohio, and at the Harvard Medical School; came to Worcester in 1851, and graduated from the Worcester Medical Institution in 1852. Soon after he formed a partnership with Dr. Calvin Newton, which lasted until the latter's death the next year. Dr. Kelley was in active practice (somewhat interfered with by his official duties) until 1883, and in 1874 became a member of the Massachusetts Medical Society. In December, 1879, he was elected mayor of Worcester, and re-elected in 1880, having previously served the

city four years in the Common Council and six on the Board of Aldermen. He was a member of the first Board of Trustees of the City Hospital; was elected presiding officer, and served in this capacity until 1883. From 1877 he was one of the commissioners of the "Jacques" and other funds of the hospital, and chairman of the committee.

1852.—JOHN E. HATHAWAY, M.D., son of Samuel Hathaway, was born in Worcester in 1828. In 1846 he left home to take a position in the apothecary store of Theodore Metcalf & Co., in Boston, and not long after received an appointment as house apothecary to the Massachusetts General Hospital. Here he became interested in medical pursuits, and, connecting himself with the Tremont Street Medical School, began the study of medicine. As a student he took high rank, and received the Boylston prize. He was for a few months house physician at the hospital, and graduated from Harvard with the medical class of 1852. In the same year he came to Worcester, and, after the usual struggle of the young doctor, had just acquired a good practice when, in 1859, the first symptoms of the disease from which he afterwards died, appeared. Receiving no benefit from either the South or Europe, in April, 1861, he removed to Shrewsbury, to try the effect of an out-door life, but gradually sank, and died January 12, 1862, at the age of thirty-four. He was a member of the Massachusetts Medical Society, of the Worcester Society for Medical Improvement, and from 1855 to 1858 secretary of the District Medical Society.

1854.—J. MARCUS RICE, M.D., was born in Milford, N. Y., July 31, 1827; he graduated in medicine at Castleton, Vt., in 1853, and, after a year spent in the hospitals of London and Paris, opened an office in Worcester. He was for several years city physician, and in 1859 was appointed coroner by Governor Banks, which position he held until the coroner system was abandoned, since which time he has been "medical examiner" for this district. In 1861 he examined recruits for the Twenty-first Regiment, and went with it as far as Annapolis, but declined a commission and returned, to become surgeon of the Twenty-fifth, with which he went to the front September 16th. He served throughout the war, and spent the summer of 1865 as health officer to the port of Norfolk. At the battle of Roanoke Island he was wounded in the chest. While on outpost duty near Newbern, N. C., in 1863, he was captured and spent six weeks in Libby Prison. He was successively regimental, brigade and division surgeon, acting medical inspector of the Eighteenth Army Corps, and medical inspector of the Army of the James. At the expiration of his term of enlistment his application to be mustered out was returned, endorsed as follows: "The services of this officer are so valuable that his application is returned in the hope that he will retain his present appointment, with the assurance that he shall be mustered out at any future

time, should he so desire." Dr. Rice is a member of the American Medical Society of Paris; of the Massachusetts Medico-Legal Society, and of the Royal Geographical Society of London. He served fifteen years as surgeon to the City Hospital, and is now a member of the consulting board. During 1879-80, and again in 1880-81, he represented Ward Eight in the Legislature.

1855.—FRANK H. RICE, M.D., born in Rowe, Mass., in 1831, graduated at the Medical School at Woodstock, Vt., in 1854. From 1857-64 he was assistant physician at the Lunatic Hospital, and from 1864-71 in general practice in the city. In the latter year he removed to Passaic, N. J., where he still remains.

1856.—JOSEPH N. BATES, M.D., was born in Barre, March 16, 1811, and began the study of medicine with his father, Dr. Anson Bates, of that town, in 1829. He attended lectures at Bowdoin, Me., in Philadelphia, and at the Dartmouth Medical School, where he graduated in 1831. For twenty-five years he practised medicine in Barre, and was well and favorably known throughout the whole of that section of country. In 1856 he came to Worcester, and in 1861 went to the front as surgeon of the Fifteenth Regiment, but was forced by ill health to resign in July, 1862. He remained in Worcester in active practice until his death, February 22, 1883, at the age of seventy-two. He was a permanent member of the American Medical Association, a member of the Massachusetts Medical Society, and, in 1857-58 a trustee of the State Lunatic Hospital. A son of Dr. Bates is now in practice in Baltimore.

1856.—THOMAS H. GAGE, M.D., is the son of Dr. Leander Gage, of Waterford, Me., where he was born May 22, 1826. He studied medicine at the Tremont Street Medical School, in Boston, and at the Harvard Medical School, where he graduated in 1852. He was for one year house-surgeon at the Massachusetts General Hospital. From 1853-56 he practiced in Sterling. In 1856-57 he was assistant physician at the State Lunatic Hospital in Worcester, and has since that time been in general practice here. In 1880 he delivered the annual address before the Massachusetts Medical Society, of which he was in 1881-82 vice-president, and in 1886-88 president. He was for nine years a member of the visiting staff of the City Hospital, for seven years a member of the consulting staff, since 1880 has been one of its trustees and is now the president of the board. Of the Memorial Hospital and Washburn Dispensary he was one of the original trustees under the will, and is vice-president of the board. Since 1876 he has been a trustee of the State Lunatic Hospital and of the Asylum for the Chronic Insane, is a trustee of the Old Men's Home, of the Worcester County Institution for Savings, a director of the City National Bank and of the State Safe Deposit Company, a past member of the Worcester Fire Society, member of

the American Antiquarian Society, and medical director and vice-president of the State Mutual Life Assurance Company.

1858.—ANSON HOBART, M.D., A.B. (Williams, 1836), was born in Columbia, N. H., in 1814. He fitted for college at the Meriden Academy. After graduating, he taught school for some years in Freehold, N. J., and then studied medicine with Dr. Lloyd, of that place. He graduated at Castleton, Vt., in 1843, spent some months in study in New York, and began practice in Southborough, where he remained fourteen years. In 1858 he came to Worcester, where he has since remained.

1858.—SAMUEL F. HAVEN, JR., M.D., A.B. (Harvard, 1852), son of Samuel F. Haven, so long librarian of the American Antiquarian Society, was born at Dedham May 20, 1831. He studied medicine with Dr. Henry Sargent, and at the Harvard Medical School, from which he graduated in 1855. In the school he took a leading position and received the Boylston prize. One year was spent as house physician in the Massachusetts General Hospital, and two in study in Europe, where he particularly devoted himself to diseases of the eye, visiting London, Paris, Vienna and Berlin. On his return, in 1858, he opened an office in Boston, but soon removed to Worcester. In 1861 he went out as assistant surgeon of the Fifteenth Regiment, and in July, 1862, was appointed surgeon, on the resignation of Dr. Bates. At the battle of Fredericksburg, December 13th of the same year, he was assigned to hospital duty, but, at his own earnest request, was allowed to go forward with his men, and while caring for the wounded, was so severely injured by a shell that he died on the field four hours later. His death in such a manner, at the age of thirty-one, made a profound impression, and his funeral in Worcester, December 24th, resembled that of some man long in public life. Flags were everywhere at half-mast, the Home Guards performed escort duty, and eight of the oldest physicians in the city acted as bearers.

1859.—PETER E. HUBON, M.D., was born in Ireland about 1833. In 1848 he came to this country, by his own exertions acquired an education, studied medicine and graduated from the Albany Medical School in 1858. He was, for a few months, in practice in Springfield, but in 1859 came to Worcester, where he was the first, and for many years the only, Irish physician. In 1861 he was city physician. He served throughout the war in various regiments, being promoted for efficiency to the position of "Surgeon of Division." He resigned in 1865, and, after spending six months in Europe, resumed practice in Worcester, where he remained until his death, March 3, 1880. From 1865-71 he was in charge of the Sisters' Hospital on Shrewsbury Street.

1865.—ALBERT WOOD, M.D., B.S. (Darmouth, 1856), son of Samuel Wood, born in Northborough, Mass., February 19, 1833, taught school from 1856-

59, and then entered the Harvard Medical School, from which he graduated in 1862. He was assistant surgeon of the Twenty-ninth Regiment Massachusetts Volunteers from July, 1862, to August, 1863; surgeon of the First Massachusetts Cavalry from August, 1863, to November, 1864; and acting staff surgeon to the close of the war, when he settled in Worcester. He was city physician five years, surgeon at the City Hospital ten years and is now one of the trustees. He is now, and has been for thirteen years, treasurer of the Worcester Lunatic Hospital and, since 1877, of the Worcester Insane Asylum. He has been superintendent of the Washburn Dispensary since 1874, and is a trustee of the Memorial Hospital. He was director of the Public Library six years, and for one year a member of the State Board of Health, Lunacy and Charity. He is a director of the State Mutual Life Assurance Company, surgeon to Post 10, G. A. R., and a member of the Loyal Legion. He is one of the Board of Pension Examiners, connected with various medical societies, and councillor of the State Society.

1865.—GEORGE E. FRANCIS, M.D., A.B. (Harvard, 1858), son of James B. Francis, was born in Lowell May 29, 1838. He began the study of medicine in 1859 at the Harvard Medical School and Chelsea Marine Hospital. From June to September, 1861, he was assistant surgeon at Fortress Monroe. In May, 1862, he was appointed house surgeon in the Massachusetts General Hospital. From August to October, 1862, he was at the front as volunteer surgeon. Receiving his medical degree from Harvard in 1863, he was, in May, appointed assistant surgeon in the navy. He served in the West, chiefly on the Mississippi River and at Cairo, and was in the Red River expeditions. He resigned his commission in October, 1865, and has since been in practice in Worcester. He is a member of various medical societies and councillor of the State Society. For a short time he was connected with the Washburn Dispensary, has been fifteen years surgeon to the City Hospital and is consulting surgeon to the Memorial Hospital. He is a member of the Antiquarian and Worcester Fire Societies, has served one term as director of the Public Library and was for some years a member of the School Board.

1866.—EMERSON WARNER, M.D., A.B. (Wesleyan, 1856), was born in New Braintree in April, 1831. For five years he was instructor in Wilbraham Academy. Studying medicine as opportunity offered, he entered the Harvard Medical School in 1861, and graduated in 1863. He practised three years in Shrewsbury, and then removed to Worcester. He has been connected with the Washburn Dispensary and is consulting surgeon to the Memorial Hospital. He has been surgeon of the City Hospital seventeen years and is a councillor of the Massachusetts Medical Society. For twenty years he was a member of the School Board, and in 1883-84 and again in 1884-85

represented Ward 7 in the Legislature. During the latter term he was chairman of the committee on public health.

1866.—JOHN G. PARK, M.D., A.B. (Harvard, 1858), was born in Groton, Mass., in 1838. He studied medicine three years at the Harvard Medical School, and in 1861 was appointed *interne* in the Massachusetts General Hospital. In February, 1862, he became assistant surgeon in the navy, and served until November, 1865, when he was honorably discharged. He took his medical degree in 1866, and opened an office in Worcester. Five years later he was appointed superintendent of the Worcester City Hospital on Front Street. The next year (1872) he became assistant superintendent of the State Lunatic Hospital, in 1877 superintendent of the Asylum for the Chronic Insane and in 1879 superintendent of the Worcester Lunatic Hospital. He spent the summer of 1881 in Europe, devoting special attention to English methods for the care and management of lunatics. He is consulting physician to both the Memorial and City Hospitals.

1867.—H. Y. SIMPSON, M.D., was born in New Hampton, N. H., September 13, 1843. After one year's study at the College of Physicians and Surgeons of New York, and two in the Harvard Medical School, where he received his degree, he opened an office in Worcester. He was one of the original members of the City Hospital staff, but resigned, and, at the same time, withdrew from the profession in 1872.

1869.—WESLEY DAVIS, M.D., was born in Northfield, Vt., September 15, 1841. His father's death, in 1862, closed abruptly his academy life and plans for college. In 1863 he joined the army, was detailed as hospital steward, and until the end of the war remained at the base of supplies of the Army of the Potomac. He studied medicine with Dr. Bradford, of Northfield, Vt., and attended lectures at the University of Vermont, taking his degree at the Berkshire Medical School in 1866. For three years he practised in Westport, N. Y., since then in Worcester. He is a councillor of the Massachusetts Medical Society, and since 1881 has been physician to the City Hospital.

1886.—WORCESTER MEDICAL ASSOCIATION.—October 27, 1886, a general meeting of the Worcester members of the Massachusetts Medical Society was called "to consider the formation of an association to supplement the work of the district society." Such an association was formed. Bi-monthly and monthly meetings are held, at each of which a paper on some medical subject is presented and discussed. Dr. Merrick Bemis has been president for the past two years and Dr. A. C. Getchell secretary. All Worcester members of the Massachusetts Medical Society are eligible for membership, together with those living within a radius of fifteen miles.

Among the numerous other physicians here for

short periods only were John Homans, afterwards of Boston, for a few months in 1815; Erasmus D. Miller (in 1838-39), afterwards successful in Dorchester, Mass.; Henry Bigelow (son of Captain Lewis Bigelow), A.B. (Harvard, 1836), M.D. (Harvard, 1839), afterwards a leading man in Newton; Amory Hunting, here for four or five years about 1840, and then in Kansas; H. F. Johnson, with a large business, from 1840 to 1849; Henry G. Davis (in 1839-41), later of New York, where he became known as an orthopedist; John R. Lee, assistant physician at the Lunatic Hospital from 1842 to 1854; E. A. Smith, nephew of Dr. Chandler, assistant at the hospital from 1852 to 1857, and later assistant to Dr. Kirkbride in Philadelphia, now living in New York City; Frederick Heywood, born in Worcester, June 30, 1823, A.B. (Dartmouth, 1845), M.D. (University of Pennsylvania, 1848), who soon went to Central America, where he died in 1855; H. C. Prentiss, A.B. (Harvard, 1854), at the hospital from 1858 to 1863, now of Boston; C. W. Whitcomb, for many years in practice in Barre; Joseph Draper, M.D. (Jefferson, 1858), since 1873 superintendent of the Vermont State Lunatic Hospital, who was assistant at the hospital here from 1865 to 1870; H. O. Palmer, M.D., for the last sixteen years in practice in Hubbardston, who was in general practice here from 1867 to 1870, and assistant at the asylum in 1870-71; Dr. L. S. Dixon, now of Boston, was in practice here from 1871 to 1887; Dr. G. J. Bull, now of Paris, France, from 1874 to 1881, and Dr. W. H. Workman, now of Nantucket, from 1873 to 1887.

**HOSPITALS.**—The first, and for more than one hundred years the only, hospitals were those for the treatment of the small-pox. Patients with this disease were, in the epidemic of 1752, and later, taken to Dr. Robert Crawford's house on the Green Hill farm. In 1776, when four per cent. of the inhabitants died (which in 1888 would mean three thousand deaths from the disease), Dr. Joseph Lynde had charge of the hospital. In 1794 so severe was the epidemic that several hospitals were opened in various parts of the town, and placed under the supervision of Dr. Elijah Dix. One of these stood near Nelson Place, in the northern part of the city, where a head-stone in a field still marks a solitary grave. Dr. Jenner's discovery of the protection afforded by vaccination in 1798 and the gradual abandonment of inoculation, made the small-pox hospital of less and less importance, and the present pest-house of the city of eighty thousand persons is little, if any, larger than was that of the hamlet of fifteen hundred. In 1888 five thousand dollars were appropriated for the purchase of land and the building of a hospital for contagious diseases. This appropriation has not yet been used.

**STATE HOSPITALS.**—1832.—*Worcester Lunatic Hospital* (formerly *State Lunatic Hospital*).—The opening of this hospital was a notable event, as it

was the third insane asylum in New England, antedated only by the Hartford Retreat and the McLean Asylum, in Charlestown, and was the first lunatic hospital established by a State government in this country, primarily for the reception of patients "who had committed deeds, which, committed by persons in sane mind, are heinous crimes, of pauper lunatics, & of those who at large would be dangerous to the community." A large proportion of the one hundred and sixty-three patients admitted during the first year after it was opened had been confined in jails and almshouses, many of them in chains, and for long periods of time—some of them for more than twenty years.

Its establishment was largely due to the exertions of the Hon. Horace Mann, who, representing the town of Dedham in the Legislature in 1829, reported orders for the "appointment of a committee to ascertain the practicability of procuring an asylum for the keeping of lunatics and persons furiously mad, and to ascertain from the various towns of the Commonwealth the number, age, sex and color of persons reputed to be lunatics." Two hundred and sixty-nine insane persons were found in jails, almshouses and other places, besides sixty in Charlestown (McLean Asylum).

In 1830 it was determined to build, and the town of Worcester having, at an expense of two thousand five hundred dollars, purchased and presented to the State twelve acres of land to build here, thirty thousand dollars was appropriated for this purpose. To this sum twenty thousand dollars was afterwards added for furnishing. March 24, 1832, the Governor and Council appointed, as the first board of trustees, Horace Mann, Bezaleel Taft, Jr., William B. Calhoun, Eben Francis and Alfred D. Foster. Francis C. Gray was appointed in place of Mr. Francis, who declined to serve. Dr. Samuel B. Woodward, of Wethersfield, Conn., was selected as "Superintendent & Physician." The centre building of the Summer Street Asylum and two wings, ninety feet long and three stories high, were built on what is described as "land of a singularly regular and beautiful location, commanding a view of the town and the rich surrounding country, sufficiently near to the market, and yet so retired as to be secure from improper intrusion or disturbance, and within a short distance of the head-waters of the Blackstone Canal." The first patient was received January 19, 1833, and by the end of the year the hospital was full to overflowing. Two lateral wings were built in 1835, and other additions were made from time to time, generally by legislative action, but, in one notable instance, by private generosity,<sup>1</sup> until, in 1877, the number of patients had risen from one hundred and twenty to over four hundred. In the mean time the

<sup>1</sup> The Johannot gift, from which two wings of three wards each were built.

new hospital on Belmont Street had been built on land purchased by the State of various private owners at an expense of \$110,000 (the buildings costing enough to bring the total cost of the completed hospital to nearly \$1,200,000), and to it the patients were in this year transferred.

Two large wards for suicidal cases have been built since that time; otherwise the hospital remains as then planned. Eight hundred patients can now be accommodated. Fifteen thousand have received treatment since 1833. The number of trustees has been increased to seven, two of whom are ladies.

The superintendents have been: Samuel B. Woodward, M.D., 1832-46; George Chandler, M.D., 1846-56; Merrick Bemis, M.D., 1856-72; Barnard D. Eastman, M.D., 1872-79; John G. Park, 1879. There are at present five assistant physicians,—Dr. Alfred I. Noble, Dr. Frederick H. Daniels, Dr. Hartstein W. Page, Dr. Elmer E. Brown and Dr. Laure Hulme.

1877.—*Worcester Insane Asylum* (formerly Temporary Asylum for the Chronic Insane at Worcester).—After the transfer of patients to the new buildings of the Worcester Lunatic Hospital the deserted Summer Street Asylum was converted into an hospital for the chronic insane, and opened for this purpose under the superintendence of Dr. John G. Park, October 23, 1877. The inmates consist only of "such chronic insane as may be transferred thereto from other hospitals by the Board of State Charities." No private patients are or can be received. It was supposed that the Worcester Lunatic Hospital would eventually furnish accommodations for this class of patients and that the old buildings would be abandoned. Such has not proved to be the case, and in the ten years since its establishment nine hundred and twenty-three patients have been received. The hospital can accommodate about four hundred patients, and is kept constantly full. Dr. H. M. Quinby succeeded Dr. Park as superintendent, in 1879. Dr. Ernest V. Scribner, appointed in 1884, is assistant physician; Dr. Albert Wood, treasurer. The trustees are the same as for the Worcester Lunatic hospital.

1864.—*Dale United States Army General Hospital*.—Established by order of the War Department, in the spring of 1864, and designed to receive chiefly soldiers from Massachusetts regiments. This hospital was formally dedicated February 22, 1865, in the presence of the Governor and his staff, and many gentlemen distinguished in military and civil life. The brick Academy building on Providence Street served as a nucleus for offices, etc., and in the rear were erected fourteen wooden pavilions, each one hundred and sixty by thirty feet, all connected by a corridor along the frontage, and that again with the main building. Stables, carpenter shop and bakery were also built. The whole would accommodate one thousand patients, but there were never more than six hundred in the hospital at any one time.

Dr. C. N. Chamberlain, now of Lawrence, was in

charge from August, 1864, to October, 1865, when he left the service, and was succeeded by Surgeon Warren Webster, United States Army, who remained a few months longer, soon after which, the emergency for which the hospital was created having passed, it was discontinued.

The name, Dale Hospital, was in compliment to the surgeon-general of Massachusetts.

1871.—*City Hospital*.—Dr. Albert Wood, city physician, in his annual report to the city government in 1870, strongly advised the establishment, by the city, of a hospital to accommodate at least twenty-five patients.

After much agitation of the subject, an act of Legislature (approved May 25, 1871) provided that the city of Worcester might "establish and maintain a hospital for the reception of persons who, by misfortune or poverty, should require relief during temporary sickness."

The Abijah Bigelow estate, on the northwest corner of Front and Church Streets, was rented and the old house altered to accommodate eight to ten persons. Dr. John G. Park was appointed superintendent of a staff of twelve physicians chosen, and the first patient received October 26th of the same year. The building was immediately crowded, and during the last three months of the first year twenty patients were rejected for want of room. In March, 1872, Mr. George Jaques, always interested in the hospital project, and secretary of the Board of Trustees, presented to the city the deed of three and a half acres of land, valued at thirty-five thousand dollars, on the south side of Prince Street (Jaques Avenue), as a site for a hospital. He died in August of the same year, leaving the bulk of his property—of the estimated value of over two hundred thousand dollars—for the furtherance of the same object.

This property included a large tract of real estate on Wellington and Chandler Streets, and in January, 1874, the Front Street property was abandoned and the hospital transferred to the Jaques homestead, on Wellington Street, as quieter and more commodious. This building stood at the head of the present Jaques Avenue. Sixteen patients could now be cared for, but there was still constant demand for more room, and in 1876 two pavilions of wood were added to the house, one accommodating eight and the other five patients. By the terms of Mr. Jaques' bequest, the city was obliged to pay a forfeit of two hundred dollars a month until a permanent building should be erected on the site bequeathed for that purpose. Strong objections to this site existed in certain quarters, but work on a permanent structure was begun in 1880, and, December 8, 1881, the patients were transferred to the present building, then consisting of the administrative building, and the two wards, known as F and M, with kitchen and laundry.

In 1882 an isolating ward—now a corridor—was added. In 1884 a new isolating ward of wood was built, and in 1885 the gift of Mrs. Sarah Gill and Mr. Stephen Salisbury enabled the trustees to build the Gill and Salisbury wards—both imperatively demanded by the great increase in applications for admission. A bequest of Mrs. Helen C. Knowles, of the amount of twenty-five thousand dollars, became available in 1887, and in 1888 the Knowles Lying-in Ward, admirably adapted for the purpose for which it is designed, was erected and is now in operation as part of the hospital. In seventeen years the number of beds has been increased from eight to sixty, and the yearly number of admissions from one hundred and sixty-nine to eight hundred and forty-five. A training-school for nurses was established in 1883; during the last year extensive improvements were made in kitchen and general arrangements, and the hospital may now fairly be considered to fill the place, not only of a city, but, to a large extent, of a county hospital,<sup>1</sup> many of its patients coming from the neighboring and more distant towns.

More than six thousand patients have been treated since it was opened. Dr. John G. Park was superintendent in 1871-72, Dr. L. Wheeler in 1872-74, Dr. C. A. Peabody in 1874-76, Dr. J. B. Rich in 1876-81, and Dr. C. A. Peabody from 1881 to the present time.

Of the original visiting staff, Drs. E. Warner and G. E. Francis still remain; Drs. J. G. Park and H. Y. Simpson resigned in 1872, Dr. Gage in 1880, Dr. Martin in 1882, Drs. R. Woodward and G. A. Bates in 1883, Drs. Wood and J. N. Rice in 1886, while Drs. H. Clarke and J. N. Bates died while still members, the former in 1880 and the latter in 1883. Vacancies thus occasioned were filled by the appointments of Drs. J. O. Marble and L. Wheeler in 1872, Drs. J. B. Rich and C. A. Peabody in 1880, Drs. W. H. Workman and Wesley Davis in 1881, Dr. O. H. Everett in 1883, Dr. S. B. Woodward in 1886 and Dr. A. C. Getchell in 1888.

At present the staff consists of—physicians: Drs. J. O. Marble, Wesley Davis, J. B. Rich, A. C. Getchell; Surgeons: E. Warner, G. E. Francis, O. H. Everett, S. B. Woodward. Dr. Dixon, oculist and aurist from 1874, was succeeded in 1888 by Dr. D. Harrower, Jr., and Dr. W. H. Danforth was appointed pathologist. Dr. L. Wheeler has charge of the Knowles Maternity Ward. On the consulting staff are Drs. Martin, J. M. Rice and J. G. Park.

The Board of Government consists of seven trustees, chosen by the City Council in concurrence in

January,—one from the Board of Aldermen, two from the Common Council and four from the citizens at large. On this board the medical profession has been represented by Drs. Sargent, Kelly, Gage and Wood.

**PRIVATE HOSPITALS.**—1863.—*Wellington Hospital.*—From January to October, 1863, Mr. Timothy W. Wellington maintained, at his own expense, on Mason Street, a hospital for sick and disabled soldiers. There were accommodations for thirty persons, and, perhaps, one hundred in all received treatment and care. "Dr." Lunsford Lane, once a slave, was in charge and was assisted by his wife and daughter. Dr. O. Martin, who, as surgeon of the board of enrollment, had charge of everything medical or surgical pertaining to soldiers in this Congressional district, visited the sick as opportunity offered, other physicians occasionally assisting.

1867.—*Sisters of Mercy Hospital.*—In January, 1867, Rev. John J. Power, pastor of St. Anne's Church, on Shrewsbury Street, opened, in the building next east of that structure, a hospital for the benefit of girls living out in service. To "encourage providence and maintain self-respect," a trifling monthly sum (twenty-five cents) was required by which the payer became entitled to a bed, nursing and medicine in time of sickness. Eighty-three hundred dollars was obtained by a fair held in October, 1866, and the hospital remained in operation until the City Hospital was opened in 1871. About fifteen patients were treated each year; the nursing was done by the Sisters of Mercy. Dr. Peter E. Hubon was in regular attendance, but the institution received visits from other physicians of the city, many of whom offered their services.

1872.—*Herbert Hall*, a private hospital for mental disease, established by Dr. Merrick Bemis, who still manages it, is situated on Salisbury Street, near the Highland School.

1874.—*Washburn Free Dispensary.*—By the will of Ichabod Washburn, who died in 1869, a generous sum was left in the hands of trustees to be expended in the foundation and maintenance of a hospital and dispensary in memory of his deceased daughters. When, in 1873, the bequest became available, the City Hospital was in operation, and, as another would at that time have been superfluous, it was determined, after ineffectual attempts to consolidate the interests of the two institutions, to open the dispensary only. Accordingly the building on Front Street, just vacated as a hospital, was secured and the dispensary maintained there, and at the building No. 11 Trumbull Street until 1888, when it was transferred to a house fitted up for it, on the grounds of the Memorial Hospital on Belmont Street. Physicians are in attendance daily from 11.30 to 1, Sundays and holidays excepted. Patients unable to come to the dispensary are visited at their homes.

In the fourteen years since it was established about

<sup>1</sup> In 1850 great efforts were made for the establishment of a county hospital here, but sufficient money could not be secured. Dr. Wilder, of Leominster, first presented the subject at a meeting of the District Medical Society.

thirty-five thousand poor persons have received medical advice and treatment, to whom eighty thousand visits and consultations have been given.

The attending physicians at present are Drs. O. H. Everett, David Harrower, Jr., A. C. Getchell, W. H. Danforth and Homer Gage. Drs. E. Warner, G. E. Francis, L. S. Dixon, L. Wheeler, W. H. Workman, S. B. Woodward and L. F. Woodward have at various times been members of the staff.

1888.—*The Memorial Hospital*, incorporated under the will of Ichabod Washburn, April 20, 1871. This hospital was first opened in June, 1888, in the Samuel Davis house on Belmont Street. It is designed exclusively for women and children, and can accommodate eighteen patients. Since it was opened it has been quite constantly full, and additional buildings will evidently be needed in the near future. Miss F. F. Rice is superintendent. The visiting staff of six physicians includes: For women, Dr. L. Wheeler, Dr. O. H. Everett, Dr. S. B. Woodward; for children, Dr. L. F. Woodward, Dr. G. O. Ward, Dr. Homer Gage.

MISCELLANEOUS.—1850.—*Worcester Medical Institution* (Worcester Medical School, Worcester Botanical-Medical College).—This school, for which the many turreted building on Providence Street now occupied by the Worcester Academy was originally erected in 1850–51, was founded by the efforts of Dr. Calvin Newton, for the instruction of those practitioners of medicine variously known as Thompsonians, Beachites, eclectics and botanic physicians. Courses of lectures had been given in rooms in Waldo block in 1846–47; an act of incorporation was obtained from the Legislature March 10, 1849; finally sufficient funds were secured to build a school on land given for the purpose by John W. Pond. Instruction was given by a full faculty, and in 1851 a class of fourteen was graduated, while nearly two hundred students had been in attendance since 1846, some from States as remote as Mississippi, Indiana and Tennessee. The school collapsed from want of patronage soon after the death of Dr. Newton, always its leading spirit.

*The Worcester Water Cure*, established by Dr. Seth Rogers in 1851 in a building rented by him of Mr. Edward Earle on Fountain Street, was maintained there with varying success until Dr. Rogers' withdrawal from the city in 1864. (See biographical notice of Dr. Seth Rogers.)

1877.—*Board of Health*.—This important board, established in accordance with legislative enactment in 1877, consists of three members, of which the city physician is *ex officio* one. The remaining two are appointed biennially by the mayor and aldermen. Its duties involve the abatement of nuisances, investigation and regulation of contagious diseases, and general oversight of all that pertains to the health of the city.

## CHAPTER CLXXXIX.

### WORCESTER—(*Continued.*)

#### HOMŒOPATHY.

BY CHARLES L. NICHOLS, M.D.

JOSEPH BIRNSTILL had the honor of introducing the practice of homœopathy to the citizens of Worcester in the year 1844. His office was in the west side of the house on Walnut Street, at the corner of Maple Street, and he continued here in practice until 1847. He then removed to Boston, where he remained for several years in active work, until his removal to Newton, where he died in 1865.

J. K. CLARK came to Worcester May 8, 1849, and remained here until 1855, when he removed to Elizabeth City, Ohio, and thence, in 1858, into Kentucky. A few years later he moved to Sacramento, Cal., where he continued to practice for a number of years.

DR. BUGBEE was in practice here in 1853 and 1854, and then removed to Warren, Vt., where he died in 1859.

LEMUEL B. NICHOLS was born in Bradford, N. H., October 6, 1816. His father though a physician of considerable skill and attainments, had destined him for a farmer's life, but literary tastes and hereditary instinct prevailed and he entered Brown University and graduated in 1842. The next four years he spent in teaching, and was instrumental in raising the grade of the public schools of Providence. While there he married Lydia C. Anthony, daughter of James Anthony, a prominent manufacturer in Providence. In consequence of the sickness of his family he became acquainted with homœopathic practice and studied its principles with Drs. Okie and Preston in that city. After the required amount of study he received his degree as a regular physician, in 1848, at the Philadelphia College of Medicine. In 1849 he came to Worcester, where he practiced as a homœopathic physician until the time of his death. Although slight in form and delicate in appearance, in consequence of his sedentary life, he possessed a wonderful constitution and great power of endurance. His quiet confidence and ready sympathy won him a large place in the public heart and gave him an extensive practice from the beginning. His death, September 28, 1883, left a wide circle of friends and patients to deplore their loss. He was one of the founders of the Worcester County Homœopathic Medical Society, and was its first president in 1866. It was his custom to avoid all public office and to confine himself strictly to the limits of professional life, seeking to elevate his chosen profession by steady, conscientious effort.

J. E. LINNELL was born at Orleans, Barnstable County, Mass., June 9, 1822. He removed to Amherst at the age of sixteen, and was educated at

Amherst College. Having studied medicine with the late Dr. L. J. Gridley, of Amherst, he obtained his diploma at the Medical Department of Dartmouth College in 1844. He began the practice of medicine in Prescott, Mass., in the spring of 1845, where he remained for one year and then formed a partnership with Dr. Wood, of East Douglas. Soon after this, in consequence of the death of Dr. Wood, he succeeded to his extensive practice, covering a large circle of families. The long rides, extending often into Connecticut and Rhode Island, and the constant strain of work at the end of nine years rendered it necessary for him to withdraw for a time. During this resting time, his attention being called to the favorable effects of homœopathic treatment, he attended a course of lectures at the Homœopathic Medical College of Philadelphia, and then settled in Worcester, January 1, 1855, as a homœopathic physician. For ten years he continued practice here in connection with Dr. L. B. Nichols, but again in consequence of failing health he was obliged to retire and gave up his practice to Dr. W. B. Chamberlain. He removed, in 1865, to Norwich, Conn., as general agent of the New York Life Insurance Company, but feeling again recruited, in a few years resumed his practice, which was continued until 1886. Since that time, his health being seriously impaired, he has withdrawn from active practice. He married, November 27, 1848, Fanny A. Graves, of Sunderland, Mass. He was a member of the Massachusetts Homœopathic Medical Society for many years and was, in 1864, president of that society. By his kindly and sympathetic manner he attracted many friends, and by his careful and conscientious treatment he aided materially the establishment of homœopathy in this city.

JOHN B. MOORE was born in Concord, N. H. After his academic education he studied medicine in the office of Dr. Alpheus Morrill in his native town. He came to Worcester in 1869, but in consequence of the death of his father a year later he returned to Concord, where he still continues in active practice.

W. E. RICHARDS practiced in Worcester during the years 1868-69. In 1870 he removed to Syracuse, N. Y., but the climate proving too harsh, he settled in Boston, where his practice was very extensive. He spent much of his time, also, in extending the advantages of homœopathic practice to the poor in the dispensaries; but a few years ago, his health being broken down by work and necessary exposure, he retired to Newton, where he now resides.

DAVID HUNT, born in Providence, received his degree at Harvard Medical School and began practice in Worcester as a homœopathic physician in 1868. Soon after his marriage he removed to Boston, where he was associated with Dr. I. T. Talbot for a short time. After several years of study in this country and abroad he returned to Boston, where he has since practiced as a specialist in dis-

eases of the 'eye. He was an active, earnest worker settled in Worcester.

WM. B. CHAMBERLAIN was born in Loudon, N. H., September 15, 1827. After a good academic education at Tilton, he entered as student of medicine in 1849 the office of Dr. Alpheus Morrill, in Concord, N. H. With him and with Dr. S. M. Cate, of Augusta, Me., as preceptors, he studied during the intervals of lectures at the Dartmouth Medical School. Later he attended a course at the Cleveland Medical College, where he graduated in 1854. He at once settled in Keene, N. H., where he remained until May, 1863. He was one of the first to introduce homœopathy to that part of the State, and by his natural qualities and earnest labors he succeeded in making the new method very popular, as well as in gathering for himself an extensive field of practice. His health giving way under the strain, he was obliged to resign his work. He went to Fitchburg for a few months to assist his brother-in-law, Dr. J. C. Freeland, and thence to New York to study in the hospitals and gain a much-needed rest. On January 1, 1866, he was called to Worcester to take the field of Dr. J. E. Linnell, and has remained here since that time. He was one of the founders of the Worcester County Homœopathic Medical Society, was twice its president and was, in 1872, president of the Massachusetts Homœopathic Medical Society. Since the beginning of his labors in Worcester he had associated with him some other physician, either as partner or assistant, each of whom, in turn, has settled here in independent practice. His ever-ready and generous aid has endeared him to his professional brethren, while his personal qualities and extensive medical knowledge have everywhere surrounded him with numerous friends and a large clientele. Though frequent absences from work have been necessary in consequence of the strain of his professional labors, he has always been overburdened with the number of those seeking his aid as soon as he resumed practice, and he still continues to do good work for the cause of homœopathy, as well as in aid of suffering humanity.

MARY G. BAKER came to Worcester in the fall of 1868, from Middleboro', Mass., where she had been engaged in a large practice in association with her husband. She gained many friends during her labors here, and was engaged in active practice until her death, February, 1880.

JOHN M. BARTON, born in Worcester, September 4, 1845, graduated at the Homœopathic Medical School of Philadelphia in 1870. After two years of practice in Newark, N. J., he came to Worcester in 1872, and was associated with Dr. W. B. Chamberlain for the succeeding three years. Since that time he has engaged in independent practice.

JOHN H. CARMICHAEL, born at Sand Lake, Rensselaer County, N. Y., January 29, 1851, graduated from the Medical Department of Union University in

1874. He settled in Worcester February, 1874, where he remained for two years, and then removed to Warren. After two years of practice in that town, and a year of renewed medical study at the College of Physicians and Surgeons, New York, he returned to Worcester in 1879, where he remained until January, 1883. In 1883 he entered into partnership with Dr. L. A. Phillips, of Boston, but in consequence of the death of Dr. H. A. Collins, of Springfield, he removed to that city, succeeded to his practice, and still continues to enjoy a large field of labor.

FRANCIS BRICK was born in Gardner in 1838, his ancestors being among the original settlers of that town. Having studied with Dr. Sawyer, of his native place, he entered the Homœopathic Hospital College of Cleveland, from which he graduated in 1861. After some years of practice in Keene, N. H., he came to Worcester in 1875, where he took the practice of Dr. Chamberlain for one year during his absence abroad. The subsequent year he remained with Dr. Chamberlain as equal partner, and then established a separate office.

CHARLES L. NICHOLS, born in Worcester, May 29, 1851, studied at the Highland Military School. He graduated at Brown University in 1872, and at Harvard Medical School in 1875. After a year at the Homœopathic Hospital of Ward's Island, New York, he entered the office of his father, Dr. L. B. Nichols, in 1876, and was associated with him until his death, in 1883, when he succeeded to his practice.

C. OTIS GOODWIN was born in Reading, Mass., April 19, 1849. Educated at Phillips Academy, Andover, he studied for some years in the office of Dr. J. N. Bates, of Worcester. He attended the Homœopathic Medical School of Boston University, and graduated in 1877. In the summer of this year he settled in Worcester, where he has remained since that time.

EDWARD L. MELLUS was born in Lubec, Me., May 24, 1848. After being engaged in business in the West for seven or eight years, he determined to enter the medical profession, and studied at Jefferson Medical School, in Philadelphia, whence he graduated in 1878. He settled in Cherry Valley in 1878, where he remained for one year, and then entered the office of Dr. W. B. Chamberlain, with whom he was associated until 1883. Since this time he has been in independent practice.

JOHN K. WARREN was born in Manchester, N. H., March 1, 1846. He graduated at the New York Homœopathic Medical College in 1870, and settled at once in Palmer, Mass. He remained there for nine years and then went abroad for a year's study in the Hospitals, returning to Palmer, where he practiced until 1882. He then came to Worcester in December of that year and has remained until the present time.

ADALINE WILLIAMS graduated from the New York Hospital College for Women in 1880, and came to Worcester after the death of Dr. Mary G. Baker, in

1880. She is now associated with Dr. W. B. Chamberlain.

In addition to those mentioned, several have established themselves in Worcester during the past two years, and the number of homœopathic physicians in the city at this time being fifteen, there seems to be a very satisfactory growth among the public in favor of this method of practice. Among the societies and associations under the auspices of the homœopathic physicians, two only need be noticed here:

1. THE WORCESTER COUNTY HOMŒOPATHIC MEDICAL SOCIETY, founded in 1866, with a membership of eight, to-day numbers forty-five active members and holds its meetings quarterly, at the society rooms, 13 Mechanic Street, where a library of about one thousand volumes has already been collected.

2. THE WORCESTER HOMŒOPATHIC DISPENSARY ASSOCIATION consists of all homœopathic physicians in the city. The meetings, on every alternate week during the winter months, are held at the rooms of the association. The dispensary, established at No. 58 Mechanic Street, October 4, 1880, by the labors of Drs. Charles L. Nichols and J. H. Carmichael, was incorporated January 15, 1885, and is supported by voluntary contributions and by a legacy of the late Mrs. L. J. Knowles. The dispensary rooms are at 13 Mechanic Street, and the hours are from ten to eleven, every forenoon. The work is in charge of the homœopathic physicians of the city, each one of whom has contributed his share of the labors of this charity.

## CHAPTER CXC.

### WORCESTER—(Continued.)

#### MILITARY HISTORY.

BY J. EVARTS GREENE.

DANIEL GOOKIN was the first person of distinction bearing a military title whose name is connected with the history of Worcester. He was appointed in 1665 chairman of the Committee of Proprietors of Lands near Quinsigamond, to promote their settlement. He was appointed in 1681 major-general of the colony, after holding minor military titles for many years. His services were highly esteemed by his associates, as those of a man so justly eminent in the councils and active service of the colony could not fail to be. He never lived here and his part in the founding of Worcester was of a civil rather than a military nature. But no military history of Worcester would be reasonably complete without mention of the name at least of this wise, valiant and humane man.

Worcester, like other early New England settlements, was at first and for many years a military colony. The need and opportunities of defence

against the savage inhabitants of the country were considered in choosing the site of the settlement, and among the earliest buildings were those strong places, fortified against Indian attack, called forts, garrisons or block-houses, built of squared logs so notched or framed at the corners as to fit closely together, and strongly pinned. The entrance was secured by a heavy door of plank. The upper story was made to project two feet or more beyond the lower, with loop-holes for the fire of the garrison, so that an attacking enemy might not take shelter against the walls out of range of the muskets fired from the loop-holes in the lower story. Block-houses so built were proof against arrows or the musketry of that time, and perfectly defensible against any attacking force unprovided with artillery. One of these block-houses was built very early, a little to the north of the present site of Lincoln Square, and on the bank of the brook which from it was called Fort River. Others were built later, one about a mile farther south on the west side of the Leicester road, another to the eastward and still another to the northward of Adams Square. At the last named a long iron cannon was mounted, rather to give the alarm in case of danger than for the effect of its shot upon the enemy.

Scarcely had the first systematic settlement of the town begun, with hopeful prospects, when Philip's War broke out, in 1675. It is unnecessary here to consider its origin or detail its incidents, since Worcester was the scene of scarcely any of its operations nor did its inhabitants, as such, take part in them. The people, few in number, far from succor and in the immediate neighborhood of the haunts of hostile savages, deserted their new homes and took refuge in the older towns. Some of them, however, performed notable feats of valor and leadership. Captain (afterwards major) Daniel Henchman commanded, in April, 1676, a force consisting of three companies of infantry and three of cavalry, co-operating with a force from Connecticut to scour the forests on both sides of the Connecticut River from Hadley northward, to harass the savages and prevent them from fishing there, as was their custom at that season. Lieutenant Ephraim Curtis, described as of Sudbury, was one of Captain Wheeler's company, who were ambushed near Brookfield and suffered great loss, and the survivors of whom were besieged in that town by several hundred Indians. Curtis, after two unsuccessful attempts, eluded the watchfulness of the besiegers and made his way on foot, through the hostile country, at great hazard, to summon relief to the beleaguered garrison.

After the sharp lesson of Philip's War the Indians of the neighborhood were no longer formidable, but the frontier settlements were harried and distressed by the incursions of the Western Indians, the Mohawks from beyond the Hudson, and in Queen Anne's War by the French and Indians from Canada.

Among the other consequences of the arrogant ego-

tism of Louis XIV. were the death or captivity of many hapless people in the frontier towns of Massachusetts and the wasting of their homes. The feeble foothold which civilization had gained in the forests and meadows of Worcester was again relinquished, because a foolish old man on the other side of the Atlantic insisted upon making his grandson King of Spain. The weariness of Europe brought peace to New England, which was weary enough, too, of alarm, ambush and massacre. The peace of Utrecht put an end to the raids from Canada, and Worcester was replanted.

But Captain Francis Nicholson, next in authority to Governor Andros, found some people in Worcester in 1688, for he writes near the end of August in that year that, finding the people disturbed by fears of Indian attacks and especially by the gathering of Indians at two forts not very far away, he sent them word not to quit the place, for they might be sure of help. He then went to Worcester, where he found some few men left and directed them to fortify the place and by no means to quit it. Captain Nicholson also visited the Indian forts, finding the Indians there afraid both of their white neighbors and of strange Indians from the West, and he persuaded them to leave their forts and go down "among the English plantations." But in spite of Captain Nicholson's encouragement and the importance of the place as a station on the road to the settlements on the Connecticut, the settlers here not being strong enough in numbers to defend themselves, again abandoned their homes, and the place lay desolate until the attempt at settlement was renewed in 1713.

Peace prevailed without serious interruption for about nine years, but in 1722 a war, not European, but American, in its origin, began. The disturbers of the peace were the Indian tribes on the north and east, the allies of the French in Canada. Five men of Worcester were employed in the defence of the settlements as scouts in the company of Major John Chandler. Sergeant Benjamin Flagg had two of them under his immediate command in the town; two others were stationed in Leicester. In the next year seven men of Worcester were enlisted as soldiers in the autumn and served through the winter. In 1724 hostile parties of Indians were discovered or suspected in the forests to the north of the town, and the selectmen, representing to the Governor that Worcester, by its position, covering the long interval between Rutland and Lancaster, lay "much exposed to the Indian rebels," petitioned for soldiers to strengthen the front garrisons and to scout the woods as a relief to the inhabitants, who were very much disheartened by reason of the present danger they believed themselves to be in. Otherwise they feared it would be impossible for the garrisons to keep their stations. Other urgent petitions for relief were made during the spring of this year, but it was not given until the summer was well advanced, when nineteen soldiers were

stationed in Worcester and remained here until near the end of October. They had no commissioned officer, but were posted as independent guards under general instructions to keep their stations, watch for the enemy and protect the inhabitants. In the same year Uriah Ward, an enlisted soldier from Worcester, was killed by the Indians at Rutland. No attack was made upon Worcester, though hostile Indians were seen and fired upon by the guard in a garrison-house. In the spring of 1725, again, the people were alarmed by the presence of hostile Indians in the neighborhood and petitioned for succor. Twelve men at least, and perhaps more, were sent by Colonel Chandler, whose military charge embraced this town with others. Indians were seen, but no attacks were made. Captain Samuel Wright, who seems to have been in command, reports in a letter to Colonel Chandler: "We have now taken a method to hunt them with dogs, and have started them out of their thickets twice and see them run out, but at such a distance we could not come at them." The Indian troubles were ended for the time at the close of this year by a treaty made with the Indians.

Since that time no public enemy, unless we may include under that description the force gathered in Shays' Rebellion, has appeared in Worcester. Instead of begging for help to defend their own homes, the people of the town have contributed largely, according to their numbers and their means, to the common defence, and never more generously than in the wars with the French and Indians, which were almost continuous from 1744 to 1763. Up to this time the men enlisted or employed as soldiers in Worcester had but short terms of service, and were not trained or instructed to march in compact bodies or to perform those movements and evolutions which are now required of all military bodies, and proficiency in which is expected of every soldier, and especially of every officer. Such training would then have been useless or worse. The operations of that time seldom required a large force—never more than a few hundred—and the nature of the country in which operations were conducted, covered with dense forests or thickets and deep morasses, intersected only by narrow paths, made movements in close columns impossible, while the skulking tactics of the enemy would have made such movements or regular formations ineffective and disastrous, as General Braddock found in Virginia. They were rather scouts than soldiers. Their equipment was simple, consisting of scarce anything besides the long king's or queen's arm, with a few spare flints and powder-horn and bullet-pouch. Their supplies of ammunition and provisions were carried on pack-horses. All the able-bodied men were enrolled in the militia. Each was required to be constantly provided with a gun in good condition for service and a supply of ammunition. All were practiced in the use of their weapons, and most of them were expert marksmen.

The colonel's command had territorial limits. He was charged with the protection of the towns within his district or within his regiment, as the familiar phrase was. It was his duty to be vigilant, to keep well informed of the condition of his frontier, to repel sudden attacks and to report his doings and news of military importance to his superior officers. He received, from time to time, as occasion required, authority to enlist, or even to impress men, for particular duty.

The officers of his regiment—major, captains, lieutenants and ensigns—were expected to look after the military interests of their respective neighborhoods, to take command according to their rank in case of attack and to report to the colonel all military information. The soldiers specially enlisted, when not employed in expeditions against an enemy in force, were posted at the garrison-houses of the frontier towns, often only one or two at a house. Their duty was to be constantly on the alert, to scour the woods in their front, so as to detect the presence of hostile Indians and, in case of attack, to form a nucleus of defence, to which the inhabitants might rally when the alarm was given. The officers were chosen by the men of their commands. The system, except the substitution of popular election for inherited rank, has a certain resemblance to the feudal military organization, and the duties of the colonel in charge of his portion of the frontier were not unlike those of such mediæval officials as the "Count of the Saxon shore" or the much later "Warden of the marches" on the Scottish border.

Henceforth Worcester, needing no immediate defence, was to contribute to aggressive military operations and to distant expeditions. In the latest Indian war the towns of Worcester, Leicester and Rutland had screened Brookfield and Mendon, which, in Philip's and Queen Anne's Wars, had suffered as frontier towns. Now the frontier had been pushed forward to Concord, New Hampshire, and Charlestown, on the Connecticut. In Massachusetts only Northern Berkshire was exposed to attack from Canada and the Northern Indians. The first of the distant expeditions in which men from Worcester were employed was that of 1745, projected by Governor Shirley and commanded by Sir William Pepperell, for the reduction of the fortress of Louisbourg, Cape Breton, esteemed the strongest place on this continent, described by Bancroft as "the key to the St. Lawrence, the bulwark of the French fisheries and of French commerce in North America." Its walls were forty feet thick at the base, and from twenty to thirty feet high, surrounded by a ditch eighty feet wide.

Massachusetts sent for the conquest of this fortress more than three thousand volunteers. Worcester's share, in proportion to her population at that time, would have been, perhaps, eight or nine men. How

many of her townspeople enlisted for that enterprise it is impossible now to ascertain, but it is known that the first-born of her native inhabitants, Adonijah Rice, was one, and that another, Benjamin Gleason, died in the service before the surrender of the place. Here our townsmen first saw and formed part of an army, though it was small, scarcely more than four thousand men, and shared in the labors and dangers of a siege.

In this war, too, there was Indian fighting after the old fashion. Eight Worcester men were of the garrison of Fort Massachusetts, in the winter of 1747-48. This fort stood where Williamstown now is. It was the extreme outpost and had been taken by the French in the year before. The next summer fifty-three Worcester men formed a part of the force of two hundred, under Brigadier Dwight, which took the field to repel an incursion of the French. The enemy retired before them, and the campaign lasted but seventeen days. The officers of the Worcester contingent were Daniel Heywood, major; John Stearns, captain; Tyrus Rice, lieutenant; Richard Flagg, ensign.

The war was brought to an end, in 1748, by the treaty of Aix-la-Chapelle, because England and France were just then tired of fighting, and their Colonies in the New World were also well content to rest a while. But, as the treaty settled nothing, and left all the old causes of complaint and quarrel, hostilities were soon resumed—this time for the final death-struggle between England and France for dominion in North America.

In 1754 thirteen Worcester men, under Captain John Johnson, served in Maine, as a part of the garrison of the forts on the Kennebec River. In the next year John Walker, of Worcester, a soldier of experience in the service of the Province, was commissioned captain in the Royal Army. Seventeen men from Worcester served in Nova Scotia, this summer, in the force commanded by the Massachusetts general, John Winslow, and, we must presume, took part in that shameful business—the removal of the Acadians from their homes, which that hard-hearted commander executed with every aggravation of deceit, treachery and cruelty. One thousand of these wretched exiles were distributed among the towns of Massachusetts, and eleven were assigned to Worcester. "These families," says Lincoln, in his "History," "torn from their homes, reduced from comparative affluence to desolate poverty, thrown among strangers of different language and religion, excited pity for their misfortunes. Their industrious and frugal habits and mild and simple manners attracted regard, and they were treated here with great kindness."

In the same year seventeen other Worcester men were stationed at Fort Cumberland; two were in the expedition against Crown Point, and fourteen others volunteered for enlistment in September, when Colonel Chandler was directed to impress men for the reinforcement of the army.

Fifty-five men of Worcester, therefore, appear to have been in the military service in that year. That was the year in which, of the four great expeditions planned against the French, three (that of Braddock for the conquest of the Ohio Valley, that of Shirley against Fort Niagara, and that of Johnson against Crown Point) came to a disastrous ending, and only the operations in Nova Scotia were successful.

The year 1756 was a time of great military activity in the colonies, activity of preparation, that is to say, for little was accomplished by the incompetent commanders whom the English Government had sent. Worcester saw more of martial display than it had ever seen before. Colonel Chandler established his regimental headquarters here, and the town was designated as the rendezvous for troops to be mustered into the service. A depot of munitions was made for the arming of the levies as they gathered here to be forwarded to the seat of war, on the western frontier. Detachments of troops arrived, camped for a while on the hills about the town, received their marching orders and were succeeded by others. One company of forty-three men was raised in the town and forty-four others were borne on the rolls of Colonel Ruggles' regiment. Many died of disease in the course of the campaign, and three were made prisoners and detained in captivity at Montreal, until the exchange in 1758. After the disastrous surrender of Fort Oswego, Lord Loudoun, commander-in-chief, fearing an attack from the French, now "flushed with success," ordered a levy of the militia for the reinforcement of his army, and the companies of Worcester, under the command of Major James Putnam, marched as far as Westfield, when Lord Loudoun, having got over his fright, countermanded his orders and they returned.

But the spirit of the colonies was not broken by the disasters of that year, and the mother-country was resolved upon the conquest of Canada. On the 20th of July, 1757, Colonel John Chandler, Jr., commanding the First Regiment, made the following report of the condition of his command, which is of interest, as illustrating not only the military demands upon our town, but also the militia system of the time:

Agreeably to an order of the honorable his majesty's council, of the fifth of July last, requiring me to take effectual care that every person, both upon the alarm and train-band lists, within my regiment, and the several stocks in said regiment, be furnished with arms and ammunition according to law, if not already provided; immediately on the receipt of said order, I forthwith sent out my warrant requiring a strict view into the state of the respective companies and town stocks in my regiment, and returns have since been made to me that they are well equipt.

And agreeably to an order of the honorable, his majesty's council of the 6th of June last, requiring me, in case of an alarm being made, or notice given of the approach of an enemy by sea, to cause my regiment to appear complete in arms, with ammunition according to law, and each man to be furnished with seven days' provision of meat, I also sent out my warrant, requiring the several companies, in such case, with the utmost expedition to march to Boston, and further to act agreeably to such orders as they shall receive. Agreeably to the order afore-

said, return has been made from the respective companies that they are ready to march at an hour's warning.

JOHN CHANDLER, JR., *Colonel*.

Colonel Chandler's regiment, with its Worcester companies, was soon called upon to test its readiness for service. Montcalm, with a force of French and Indians, besieged Fort William Henry, at the head of Lake George. General Webb, who was within supporting distance with a sufficient force, and had actually left the fort, with a large escort, just before the place was invested, hesitated and dawdled, and at length sent a letter advising the commander to capitulate. The stout-hearted Colonel Monro held the fort until half his guns were burst and his ammunition was nearly exhausted, and then, on the 9th of August, surrendered. Loudoun, the commander-in-chief, and General Webb were terrified by the prospect of attack from the victorious French army, and Loudoun even talked of retreating to Long Island and there making a stand for the defence of the continent. Colonel Chandler was ordered to march with his regiment to the western frontier. All the militia of the town promptly answered the summons. One company of fifty-six men had for Captain, James Goodwin; for Lieutenant, Noah Jones; for Ensign, Daniel Bancroft, and Nahum Willard as surgeon. The other company, numbering fifty-four men, was commanded by Captain John Curtis, and Luke Brown and Asa Flagg were lieutenant and ensign respectively. With them marched Colonel Chandler and Major Gardner Chandler. But by the time the regiment had reached Sheffield General Webb's terror had abated, the French made no further advance, and the regiment was disbanded on the 18th of August. Eight Worcester men, in a troop of horse commanded by Lieutenant Jonathan Newbold, of Leicester, were in General Webb's army at Fort Edward. Ten from this town, regularly enlisted, served during the campaign.

The incompetent and faint-hearted English commander-in-chief was recalled, and Pitt, the new minister, infused fresh spirit and energy into the councils of his country. He invited the colonies to raise armies for the conquest of Canada, promising that England would provide everything except the levying, pay and clothing of the men, and that the King would strongly recommend to Parliament to make proper compensation for these expenses. Massachusetts answered promptly and generously to this summons. Nine soldiers from Worcester were in the army which General Abercrombie, in the summer of 1758, foolishly wasted in his rash and blundering assault upon Ticonderoga. After his failure, General Amherst, having taken Louisbourg, marched from Boston for the West, with an army of forty-five hundred men. He halted in Worcester, September 17th, for a day, and was here joined by Captain Samuel Clark Paine, with his company, mostly men of Worcester, and having Daniel McFarland for lieutenant,

and Samuel Ward, of Lancaster, for ensign. This company served with the army during the winter and through Amherst's successful campaign of the next year, in which he reduced the fortress of Ticonderoga, and recovered for the English the control of Lake Champlain. In Captain Paine's company were twenty-three non-commissioned officers and privates from Worcester, and fourteen more were in other companies of General Ruggles' regiment. Besides these were William Crawford, chaplain of Colonel Willard's regiment, and Benjamin Stowell, lieutenant in Captain Johnson's company. Captain Paine died in December, 1759, and Lieutenant McFarland succeeded him in command of the company. William Ward was made lieutenant, Ensign Samuel Ward having been promoted to the rank of adjutant of Colonel Willard's regiment. Thomas Cowden, from Worcester, was lieutenant in Captain Jefferd's company, which had the names of twelve Worcester men on its rolls. Cowden was made captain in the following year, 1761, and twenty-five Worcester men were in the army in that year. In the last year of the war, 1762, Worcester appears to have had, so far as is known, only nine men in the military service. The population of the town at this time was probably not far from one thousand. From this number she gave to the provincial service between the years 1748 and 1762, according to Lincoln, who made a careful study of the rolls and other records at the State House, which it was not in my power to make, one colonel, one lieutenant-colonel, two majors, six captains, eight lieutenants, seven ensigns, twenty-seven sergeants, two surgeons, one chaplain and one adjutant, besides about four hundred and fifty privates. These numbers do not include those—of whom there were certainly some, but how many cannot be known—who enlisted in the royal army, nor the militia called into service for short terms of active duty. To furnish so much of strength, valor and enterprise required great exertions and sacrifices, and the military rank which so many of its sons attained implied great honor to a little and poor town, which saw but few years of settled peace since its establishment. While sending one-third, at least, of their effective men into the field, the people of Worcester, in common with their fellow-citizens of other Massachusetts towns, were taxing themselves for war expenses to an extent that would be deemed ruinous and intolerable in these days. The tax in one year was, says Bancroft, thirteen shillings and four-pence on the pound of income, besides various excises and a poll-tax of nineteen shillings on every male over sixteen. Such was the martial temper, and such the generous public spirit of our ancestors.

The people of Worcester, and of other towns of New England, were prepared for the great military struggle of the Revolution by almost continuous warfare since the founding of the colony. The Indian wars taught them self-reliance, vigilance, mastery of their weapons, endurance and prompt and strenuous action in

emergencies. The later French wars, with their larger armies and the sieges of Louisbourg, Ticonderoga and Quebec, gave them lessons in the art of organizing, disciplining, marching and subsisting a considerable force, in manœuvring in the presence of an enemy, in fighting battles, in the use of artillery, in constructing, defending and attacking fortifications. Very few, if any, of them were masters, or even scholars of the science of war, but many were admirably proficient in the practical duties of the soldier and the officer. Twelve or thirteen years had elapsed, it is true, since the end of the last French war, before the clash of arms at the beginning of the Revolution, and doubtless much the greater number of the men called to arms to maintain the rights of the colonies had no military experience, but many of them had served under Amherst and Abercrombie and Howe in battle and siege. They knew what the King's troops could do, for they had seen and helped them do it. They knew that the man in a red coat, though a good soldier, was no better than his comrade in the dress of the provincial levies, and not always so good. They remembered that the largest and most perfectly-equipped army ever mustered on this continent, commanded by a famous British general, was repulsed with terrible slaughter under the walls of Ticonderoga, and that under the command of a Massachusetts merchant, a much smaller New England army had compelled the surrender of Louisbourg, a much stronger fortress. These veterans leavened the army and preserved it from an inordinate respect for the King's troops.

Political movements tending toward revolt against the authority of the mother country had been in progress for some time when the first action of a military nature was taken, late in the summer of 1774. Some of the Tories of Worcester, about this time, irritated and alarmed by the strong measures adopted by their townsmen, withdrew to Stone House Hill, in the corner of Holden, either for their personal safety, or with some vague notion that the position might be of advantage in case of an advance of the royal army into the interior. They strengthened somewhat the natural defences of the place, and, with their arms and a store of provisions, kept their position for two or three weeks, and then, having no reason for staying longer, they went home. Their stronghold was afterwards known as the Tory Fort. But this was a burlesque of military operations. More serious was the general alarm, given a little later, that hostilities had broken out at Boston, whereupon thousands of the militia set out for that place. In Worcester the companies were summoned and the night was spent in running bullets and in other preparations for the field. In the morning the march was begun and continued as far as Shrewsbury, where advices from Boston were received, showing that the movement was needless. But the incident proved that the people

were ready for resistance, and would not shrink from the conflict of arms, if it must come. The need of preparation was manifest, and it could not wisely be postponed. The Political Society—an organization of patriots, which had for some time taken the management of town affairs—bought two pounds of gunpowder for each of its members, and required each inhabitant to sign an agreement to provide arms and ammunition. Captain Timothy Bigelow enrolled a company of minute-men and drilled them diligently every evening. Muskets had been procured for them in Boston. The town bought four field-pieces, which Jonathan Rice and others, at considerable cost and risk, brought out from Boston, and Captain Edward Craft organized an artillery company. September 21st a convention of the Committees of Correspondence for the towns of the county was held in Worcester, which, among other things, undertook the task of re-organizing the militia. All the subordinate officers were directed to return their commissions to their colonels, and the colonels to publish their resignations in the newspapers. A new division of the militia into regiments was made, the First Regiment including Worcester, Leicester, Holden, Spencer and Paxton. It was directed that the companies should elect their own officers, and that these should meet and elect the colonels and other regimental officers. One-third of the men fit for duty between the ages of eighteen and sixty were to be enrolled, organized into companies and hold themselves ready to march at a minute's warning, and committees were to be chosen to keep them equipped and provisioned should they be called into service. The towns were invited to provide and mount field-pieces, procure ammunition and otherwise make ready for defence. In the general condition of revolt this company of resolute men, the Committee of Correspondence, in harmony with the mass of the people, though without lawful authority, having definite purposes and plans, assumed the power of legislation, and were respected and obeyed accordingly.

Later in the year a depot of munitions and supplies was established here. Provisions of beef, pork, flour and grain were collected; a quantity of lead was procured, and the inhabitants were requested to give their pewter dishes for melting into bullets. In January, 1775, the company of minute-men were exhorted to meet frequently for drill, and payment was promised them for the time so employed. Early in the spring the town was visited by two scouts or spies sent out by General Gage to examine the roads and other features of the country, and report such topographical information, by sketches, plans and descriptions, as might be useful for the guidance of a force advancing into the interior. Those employed for this purpose were Captain Brown, of the Fifty-third Regiment, and Ensign Berniere, of the Tenth. Their report was discovered among the papers left by General Gage after the evacuation of Boston a year later. With it was a plan of the village, with a

sketch of proposed works, among them an entrenched and fortified camp for two regiments on Chandler Hill, to the east of the town. These officers, disguised as countrymen, arrived in the town on a Saturday evening, and remained until Monday morning. Their appearance excited suspicion, and their character was recognized by some of the loyalists; but they took no one into their confidence, and having made all the observations and sketches they wished, went away unmolested.

In March the minute-men were directed to train half a day in each week. Each man was allowed one shilling for this duty, and a fine of like amount was imposed for absence from drill. The company, in fact, met nearly every day, and, under Captain Bigelow's command, paraded in the streets or on the Common in fair weather, and were drilled under shelter when the day was stormy. So efficient was their zealous captain as an instructor that the company, when mustered for service at Cambridge, attracted attention and praise for its discipline and proficiency in military exercises.

The event was at hand for which these preparations had been made. Before noon on the 19th of April, a horseman, dusty and weary with hard riding, galloped through the town, shouting: "To arms! to arms! The war is begun!" His white horse, bloody with spurring and spent with fatigue, fell near the meeting-house. Thus came to Worcester the news of the affair at Concord,—the first encounter of the war whose issue was to be the independence of the United States. The alarm rang out from the meeting-house bell, and the long cannon, which, in the infancy of the town, had given warning, from the block-house north of Adams Square, of the approach of savage enemies, now from the ridge at the back of the court-house roared, from its iron throat, a call of the people to arms, and defiance to King and Parliament. The men of Worcester were ready. Captain Bigelow's company of minute-men reported for duty at once, and were paraded under arms on the Common. The village pastor, the Rev. Thaddeus Maccarty, invoked the God of battles in their behalf, and the citizen-soldiers marched out, seventy-six in number, besides their commissioned officers, to meet the enemy. Captain Timothy Bigelow was in command; Jonas Hubbard and John Smith were lieutenants; the sergeants were William Gates, Nathaniel Harrington, John Kannaday and William Dana; the corporals, John Pierce, Cyprian Stevens, Joel Smith and Nathaniel Haywood; Eli Putnam beat the drum, and John Hair and Joseph Pierce were fifers. When Captain Bigelow and his minute-men marched, Captain Benjamin Flagg, with William McFarland, lieutenant, and Ebenezer Lovell, ensign, and twenty-eight enlisted men of the militia, was almost ready. They moved within an hour or two, and overtook the minute-men at Sudbury, where they had halted for a short rest. Both

companies then marched on together to Cambridge. There the militia which had assembled was, within a few days, reorganized. Captain Bigelow was appointed major in Colonel Jonathan Ward's regiment. Fifty-nine Worcester men were enrolled in a company under Captain Jonas Hubbard, promoted from lieutenant, and Lieutenants John Smith and William Gates, the latter having been first sergeant in Captain Bigelow's company. Seventeen other Worcester men were enlisted in other companies of the regiments commanded by Colonel Ward and Colonel Doolittle, and twenty more were enrolled in Colonel Thomas Crafts' artillery regiment, in which Edward Crafts, who had organized the Worcester battery, was captain, and William Dana and William Treadwell were lieutenants. Dana had left Worcester a sergeant in Captain Bigelow's company; William Treadwell had marched in the ranks of the same company as a private, and Captain Crafts had marched as a private under Captain Flagg.

The town had now put more than one hundred men into the field, and was pledged to keep them there until their purpose was accomplished. This would require exertions and sacrifices greater than those made in the French wars, which had so drained the resources of the town a few years before. One hundred men, with their equipment and maintenance, certainly bore a larger ratio to the numbers and means of the town than five regiments of a thousand men each, and their support, would bear to its present resources. If they had known from the beginning how long the war would last, and how grievous would be its demands for men and money, perhaps our forefathers would have shrunk from entering upon it. But when the demands came, faster and heavier, for men, for clothing, for provisions, for ammunition and for money, they made the necessary efforts without much flinching. And when, by these efforts and losses, they had achieved the independence of their country, they were not quite exhausted, though inexpressibly glad of the return of peace.

In the army besieging Boston the Worcester men in Colonel Ward's regiment were with the right wing at Dorchester. Fifteen prisoners of war, captured from the British army, were sent to Worcester for safe keeping early in May, and many more came later. They were paroled and encouraged to find work in the town. The Assembly of Massachusetts made provision for their support.

In the months of May and June two requisitions were made upon the town for blankets and clothing for the men in the service—one for thirty guns with bayonets, and one for powder, of which the town supplied three barrels, retaining only half a barrel for its own possible needs. Two cannon, owned by the town, were delivered to the Board of War in November for the defence of Gloucester.

Major Timothy Bigelow, Captain Jonas Hubbard and twelve other men of Worcester were among the

volunteers for Arnold's daring, arduous and futile expedition against Quebec. On the 19th of September they sailed from Newburyport, landing the next day near the present site of Augusta, on the Kennebec. Thence they made their way up that river and across the divide into the valley of the St. Lawrence. The march was toilsome in the extreme. Their baggage, ammunition and provisions were conveyed in boats, which were forced up the rapid current with great labor, and had often to be dragged or carried past unnavigable rapids or across the water-sheds between the sources of one stream and those of another. On the route Major Bigelow, in order to make out their route more clearly by the view from its summit, climbed the high mountain which still bears his name in Northern Maine, near the head-waters of the Kennebec. It is a monument to this heroic townsman of ours, grander and more lasting than any ever reared by human hands.

Arnold's little army at length arrived before Quebec near the middle of November, having suffered terribly from cold, as well as from hunger and excessive labor, for the winter sets in early in that northern region. The town, besides its great natural strength of position and its formidable defensive works, had a garrison exceeding Arnold's force in numbers. With admirable impudence he sent a flag of truce, demanding the surrender of the place. But the commander would neither surrender nor come out to fight, and Arnold did not see his way to getting in. He had, moreover, only five rounds of ammunition for each man, and was therefore in no condition to maintain a siege, even if he had force enough to invest the town. So he moved up the river twenty miles or more to await the orders of Montgomery, who, in a campaign of extraordinary brilliancy, had made himself master of the Lake Champlain country, the Upper St. Lawrence and Montreal. On the 3d of December Montgomery arrived with three hundred men, artillery and provisions, and what Arnold's men needed most, a supply of clothing suitable for the season, which was intensely cold. That patriot army, after their dreadful march through the Maine and Canadian forests, were barefooted and in rags.

Montgomery, though not sanguine, thought there was a chance of success in attempting to storm the place in a night attack. On the 30th of December the attempt was made, one party, led by Montgomery in person, attacking the defences of the lower town from the southeast, and another, under Arnold, assaulting at the same time from the northwest. The fall of Montgomery at the head of his column by the first fire from the enemy put an end to the attack in that quarter. Arnold's command, with which were Major Bigelow and the Worcester men, had at first better success. Arnold was disabled by a severe wound in the leg. Captain Jonas Hubbard was also wounded beneath the walls, and, refusing to be re-

moved, died of exposure to the fierce snow-storm. Major Bigelow and some two hundred others, under the command of Colonel Christopher Greene, of Rhode Island, carried the first battery, and penetrated so far into the town that, when they were repulsed at the second barrier, and, instead of retreating, as would have been prudent, held their position, their retreat was cut off and they were compelled to surrender. Sergeant Silas Wesson was killed and Timothy Rice mortally wounded in this attack; both were Worcester men. Major Bigelow and the other soldiers from this town were made prisoners and held in captivity until November of the next year.

In the mean time the people at home were not allowed to forget that men were wanted in January, 1776, to reinforce the army before Boston. Worcester's share was thirty-two. In May blankets were wanted, and Worcester supplied on requisition twenty-seven. In June it was men again, five thousand from the State to operate in Canada and New York. Worcester's quota was fifty-six, and the men were provided. Now, for the first time, we begin to read of bounties for enlistment. The State allowed to each man under this call a bounty of three pounds, with eighteen shillings in addition for the use of his arms and equipments. The town voted to add nine pounds to the bounty of its soldiers, and a tax of four hundred and eighty-six pounds was levied for that purpose. In July the General Court ordered that every twenty-fifth man on the train-band and alarm lists, in addition to those already raised, should be put into the service to form two regiments for duty in the Northern Department. In September there was further need of men, and one-fifth part of the militia was mustered for service with the army in New York, and at the same time a fourth of the remainder was directed to be completely equipped and held ready for the field upon receipt of orders. In December the Governor of Rhode Island called for help, fearing an invasion of his State. Two regiments marched promptly to his relief, and many from Worcester were volunteers in the ranks. Eight men of Captain William Gates' Worcester company were killed in battle or died of disease this year in the army under General Washington in New York.

In January, 1777, thirty-two blankets for the army were demanded of Worcester, and later in the same month every seventh man over sixteen years of age was drafted for eight months' service at least, to fill the quota of Massachusetts in the Continental army. In February Worcester, like all other towns in the State, was required to furnish clothing, including shirts, stockings and other articles, at the rate of one suit for every seven male inhabitants over sixteen years old. The number required at this rate was sixty-two. In March a bounty of twenty pounds, in addition to the State and Continental bounties, was voted to every volunteer who should enlist to fill the town's quota, and a tax was levied of £1,656 2s. 2d.

to pay bounties and other war expenses. A committee was also chosen at this time to ascertain how much each person had paid for the support of the army, and who must pay and how much to equalize the burden. A little later the town voted to buy one hundred muskets and bayonets and a supply of powder, to be sold to the militia at a reasonable price. As the soldiers generally furnished their own arms, there was an obvious advantage in keeping a supply for sale at a fixed price. Every sixth man was drafted in August to serve three months in the Northern army.

The experience of the French War was repeated with singular accuracy this summer. Just as Loudoun and Abercrombie, in a panic, called for immediate reinforcements to repel an invasion by the French, so General Schuyler, alarmed by the steady advance of Burgoyne, urged that every available man from New England should be sent to strengthen his army. Massachusetts responded promptly, as she did twenty years before. Again the Worcester militia—sixty-eight rank and file—commanded by Benjamin Flagg, a lieutenant-colonel by this time, with Captain David Chadwick and Lieutenants Abel Holbrook and Jonathan Stone, marched westward for Albany, but when they arrived at Hadley, the success of Herkimer at Oriskany and Stark's brilliant victory at Bennington had brought relief, and they were ordered to return.

In September again the Northern Army, now under Gates, and preparing to entrap Burgoyne, needed reinforcements, and the General Court recommended that at least half the militia of Worcester and the western counties should march to strengthen it. In December a committee to provide for the families was appointed. The sums spent in this behalf from this time to the end of the war were considerable. A report of the selectmen shows that sixty-eight men of Worcester were serving at this time in the Continental Line under enlistment for eight months, three years or the war, and received their clothing for the most part from the town. In February Worcester again furnished sixty-two suits of shirts, shoes and stockings for the army in obedience to a requisition. In April the town furnished fifteen men for service in Rhode Island with a battalion from the militia of the county, and in the same month twelve men were drafted for nine months' service to fill up the quota of the State in the Continental Army. Six more were drafted in June for an expedition to Rhode Island, and four to serve as guards for the prisoners of Burgoyne's army. In March, 1779, the town levied a tax of two thousand pounds for war purposes, and the militia officers were instructed to raise men for the service by enlistment or draft. Ten soldiers were enlisted in June, and the town borrowed £5,200 for the payment of bounties. Sixty-two suits of clothing were again provided, and in September thirty-one blankets. The selectmen about this time reported

that forty-eight soldiers then in the service had received \$1,906 as bounties on their enlistment for three years. The families of nine of them had needed assistance, and had received it during the year at the cost at current prices of £509. In August £892 was granted to pay for clothing. In September eight soldiers were raised for the army in Rhode Island at a cost for bounties of £638, and in October thirteen more for Washington's army on the Hudson. To these thirty pounds each was paid in bounties, and they were enlisted for three years. Their support by the town cost £2,515 10s.

Demands upon the town for men and supplies for the war continued unabated, if not increased in frequency and weight during the next year. In June no less than three calls for men were made and answered. Twenty-two were enlisted as the town's share of three thousand nine hundred and thirty-four required of the State for six months' service with the Continental Army. Each of these, by vote of the town, received twenty-seven pounds in agricultural produce, at the prices of 1774. In the same month twenty-eight three months' men were obtained, and five at the same time for duty at Springfield. In December twenty-nine men more were wanted for three years or the war, but the endurance of the people seemed to be exhausted and the means hitherto effectual for obtaining recruits failed. As bounties did not tempt the young men, and as the people were disinclined to submit to the process of drafting, as heretofore practiced, a new scheme was hit upon. The inhabitants were divided into twenty-nine classes, of equal taxable valuation. Each class was required to supply one soldier, and provide for his wages and maintenance. Each member paid his equitable portion of the expense, and if he was delinquent the amount was added to his tax for the next year, and collected by the usual process. By this means the men needed were mustered in February.

Worcester was required to draw heavily upon its resources of money and supplies as well as men. In May forty-three sets of blankets, shirts, shoes and stockings for the army were required; in July, twelve horses. About the same time 17,640 pounds of beef was provided at a cost of £539, and in December about twice the quantity of beef, for which £1270 was paid. In this year a tax of £30,000 in Continental currency was levied for the payment of the town's soldiers. There was no relaxation of the war exactions for the next year, 1781. In June twenty-three men for three months' service were raised by great exertions, and Worcester supplied her share of a force of five hundred for service in Rhode Island. A quarter of the militia were required to hold themselves ready to march to reinforce General Washington's army. The annual demand for blankets and clothing required from Worcester twenty-nine blankets and forty-nine sets of shirts, etc. The town this year would vex itself no more with the paper currency of

the time, but voted hard money to the amount of £414 for the payment of its soldiers and £400 for another purchase of beef for the army. The last demand for men came in March, 1782, when six were drafted for three years.

During seven years of war much more than half of Worcester's adult male population must have been in the military service, either by enlistment in the line or by being summoned for special tours of duty as militia. The whole number of Worcester men doing military service in the war is thus stated by Lincoln in his history,—one colonel, two lieutenant-colonels, two majors, seven captains, ten lieutenants, five ensigns, twenty sergeants and three hundred and eighty-nine privates.

In later wars, until that of the great Rebellion, Worcester bore no part that need be mentioned here, except that the gallant service and death at Buena Vista of Captain George Lincoln must not be passed in silence. Captain Lincoln was the son of the late Governor Levi Lincoln, an officer of the regular army, and at the time of his death was serving as assistant adjutant-general on the staff of General Wool, who said of him: "He was as brave, gallant and accomplished an officer as I ever knew."

At the outbreak of the Rebellion Worcester had among her citizens, available as military leaders, no veterans of former wars, or men of experience in actual service, but she had a considerable number who, by long service as officers of the militia, had acquired such military knowledge and training as can be gained in that service. These men, with the true instinct of the patriotic soldier, came promptly forward when the country called her sons to her defence. The value of a trained militia, as a preparation for war, was proved by the honorable military record of such soldiers as Devens, Lincoln, Ward, Sprague, Pickett, Studley and others, who in the uniformed and disciplined militia of Massachusetts, had learned the duty of the soldier, the elements of tactics and the rudiments of military organization. Some of them were unusually proficient in the discipline and movements of small bodies of troops, and were as competent to instruct and organize companies and regiments for service as professional soldiers would have been. The troops whom they commanded and prepared for the field, after a few months' practice with arms, and training in camp and on the march, became efficient soldiers, winning applause from generals commanding in the field, for their military obedience, promptness and precision of movement, steady valor and all the qualities of veteran soldiers.

The great Civil War was the third period in the military history of Worcester, as of New England. The first period, covering nearly a century, was a war for existence, against the savage tribes at first, and later against the French of Canada, and their Indian allies. Then, after a short interval of peace, began the war for political independence—a strenuous and

exhausting struggle of seven years, against the military power of Great Britain, demanding intense exertion and grievous sacrifices, which were given with a cheerful resolution and intrepid constancy that win our admiration. Then followed eighty years of peace, for in the War of 1812, with Great Britain, and that with Mexico, in 1846, Worcester, as a town had no part, and very few of her citizens were in the military service.

The third military period was shorter, but the conflict was not less terrible, and the demands of the country for men and supplies, peremptory and exacting as they were, were all honorably and cheerfully met. It is interesting to note how the methods and conduct of the rural village of Worcester, in 1775, were repeated by the busy city eighty-six years later, with such variations as the enlarged resources of the community, and the changed conditions, brought about by the wonderful progress of nearly a century in science and the mechanical arts, made possible and necessary. In each case, popular assemblies were stimulated to patriotic efforts by ardent orators. In each the people, in their municipal capacity, promptly took the initiative, without waiting for the slower movement of State and national governments. In each the town or the city raised money for the equipment and training of soldiers. In each the citizens, and especially the women, by voluntary organization and effort, provided for the relief of the families of soldiers in the field. In each the municipal government offered liberal bounties to encourage enlistments. In each resolutions were passed and pledges given by the town or city to fortify the courage of the soldiers in the field and the patriotic purpose of the general government. This close repetition by the men of Worcester, in 1861, of the acts of their forefathers, in 1775, was not the result of conscious imitation, but was due to the fact that the spirit of the people was the same and their native vigor of character had not diminished; that they had kept their political institutions and habits substantially unchanged, and therefore met an emergency in the nineteenth century with the means suggested by the genius of the people and supplied by their municipal institutions and habits of association, as their fathers had met a like emergency nearly a century before. Like causes, acting under similar conditions, produced like effects, differing chiefly in magnitude, because the people were now more numerous and their resources larger.

On Sunday, the 14th of April, 1861, the news of the evacuation of Fort Sumter, after a bombardment of two days, was received in Worcester. The heart of the people was stirred as it had never been before within the memory of men then living. Wrathful and determined, they gathered in the streets, snatched eagerly and read with fierce indignation the shameful story, hastily printed in special editions of the newspapers, that the flag of their country had been displaced on one of the national forts by the ensign

of rebellion. The next day came the President's proclamation convening Congress in extraordinary session, and calling for a force of seventy-five thousand men to take the field immediately. The Governor's order promptly followed, requiring the militia companies to hold themselves in readiness for active service. There were then two militia companies in the city,—the Light Infantry and the City Guards, both having been organized for many years and having officers of long experience in the militia service. The former was attached to the Sixth Regiment of the State militia; the latter, to the Third Battalion of Rifles. Besides these, was another volunteer company,—the Emmet Guards,—a purely voluntary organization, not a part of the State militia, but efficiently officered and well drilled.

All these companies were promptly recruited to their full standard; private business was arranged, and every man held himself in readiness for the word of command. In the mean time the citizens who had yet no call to arms cheered the young soldiers by act and word. Young men and maidens, and many whose blood age could not cool, wore the national colors as a symbol and pledge of loyalty. From every flag-staff—and there were never before so many in Worcester—flew the flag of our Union, "not a stripe erased or polluted, not a single star obscured." The air was crisp with patriotism; men inhaled it with every breath. The whole community was aglow with devotion to the Union and defiance to its enemies. Doubtless the general belief was that the conflict would be short. The bombastic vaunts of the Southern politicians had become so familiar, and seemed so ridiculously inflated to Northern ears, that our people could not believe that every fantastic display of the garb of rebellion had a real man inside it, and that behind the melodramatic eloquence of treason was a resolute and solid purpose. Northern people also knew their immense superiority in numbers, wealth and military resources, and therefore had no doubt that the Rebellion would be crushed by a few heavy blows or speedily strangled in the grasp of its mighty antagonist. These beliefs made the popular spirit more cheerful, if not more determined. The soldiers about to respond to the call of their country were encouraged by the sympathy and admiration of their companions. Banks and other employers assured their clerks that enlistment should not deprive them of employment at home; but their places should be reserved for them on their return. A meeting of citizens passed without dissent a resolution, which was confirmed by the City Council at its next meeting called for the purpose, that four thousand dollars, as the citizens' meeting passed it,—five thousand, as it was adopted by the Council,—should be appropriated "in aid of the families of such of the troops of the city as have been or may hereafter be called into the service of the country, and to provide uni-

forms and supplies for such members of the company as may need them."

The call came first to the Light Infantry, who, in the evening of Tuesday, April 16th, received orders to report in Boston to the commander of the Sixth Regiment. At ten o'clock the next morning the company marched with full ranks to the Boston and Worcester Railroad station. The rollicking, yet pathetic, strains of "The Girl I Left Behind Me," filled the air of that raw April morning with a melody which was to become sadly familiar during the next four years. People of the city and from neighboring towns thronged the streets to see the martial display, and bid the departing heroes God-speed. Several eminent citizens made parting addresses of praise and cheer, and thus the first Worcester men, with high hopes and dauntless courage, marched gaily into that vortex of Civil War, whose awful depths would engulf so many of our worthiest and dearest. Captain Harrison W. Pratt commanded this company; George W. Prouty was first lieutenant, and J. Waldo Denny second lieutenant. The company left Boston for the seat of war in the evening of the same day, and on Friday, the 19th, passed through Baltimore, where the regiment was attacked by a city mob. The regiment was the first militia regiment from any State to report with arms and equipments complete, ready for active service. Its term of service was three months, and it was employed chiefly in guard duty at Washington and Baltimore and on the railroad line between those cities.

In the mean time the Emmet Guards had been incorporated with the State militia and assigned to the Third Battalion of Rifles, which now consisted of three companies—the City Guards, Company A; the Holden Rifles, Company B, and the Emmet Guards, Company C. Their ranks were full; the men were hardy young fellows, instinct with courage and patriotism. They waited with impatience the order of march. Charles Devens, Jr., then the foremost advocate at the Worcester bar, who had formerly held rank in the militia, was elected major, and reluctantly accepted the responsibility for which he doubted his own fitness, and the honor which he thought should be given to one who had earned it by more continuous service in the militia. He was persuaded, however, to withdraw his objection and to accept the command of the battalion. On Saturday, the 20th, permission came from the Governor that the battalion should go to the front. That afternoon, affecting farewells having been spoken at a public meeting in Mechanics' Hall, Major Devens started for the front. His command comprised two hundred and thirty-eight men of all ranks. The commissioned officers were: Major, Charles Devens, Jr.; Adjutant, John M. Goodhue; Quartermaster, James E. Estabrook; Surgeon, Oramel Martin.

Company officers—Company A, Worcester City Guard: Captain, A. B. R. Sprague; First Lieutenant,

*Wm. S. Livingston.*

Josiah Pickett; Second Lieutenant, George C. Joslin; Third Lieutenant, Orson Moulton; Fourth Lieutenant, E. A. Harkness.

Company B, Holden Rifles: Captain, Charles Knowlton; First Lieutenant, J. H. Gleason; Second Lieutenant, P. R. Newell; Third Lieutenant, Edward Devens; Fourth Lieutenant, Samuel F. Woods.

Company C, Emmet Guards: Captain, Michael S. McConville; First Lieutenant, Michael O'Driscoll; Second Lieutenant, Matthew J. McCafferty; Third Lieutenant, Thomas O'Neil; Fourth Lieutenant, Morris Melavin.

These three months' troops were not actually engaged with the enemy. But their service was valuable. They protected Washington from attack, and opened and maintained a new route to the city, avoiding the dangers which, for a time, attended the passage of Union troops through Baltimore. The turbulent and treasonable elements of that city were, however, speedily quelled by the energy of General Butler and the efficiency of the troops he commanded, prominent among which were the Worcester company of the Sixth Regiment and the battalion of Major Devens, which latter was stationed during most of its term of service at Annapolis or at Fort McHenry, near Baltimore. The term of service of both these corps expired just before the disastrous battle of Bull Run. They had not been mustered out when the confusion and discouragement consequent upon the defeat of our army before Washington made it necessary to retain in the service all the troops near the Capitol whose courage and organization had not been shaken by the disaster. They cheerfully responded to the appeal to remain on duty for a few days longer, while the defeated army was reorganized. The Light Infantry, with the Sixth Regiment, had marching orders for home on the 29th of July, and arrived in Worcester on the 1st of August. The battalion of rifles began their return on the 30th of July, and were welcomed in Worcester on the 2d of August. Both, of course, were received with rejoicing and hearty congratulations.

Major Devens did not return in command of the battalion, for he had already been commissioned as colonel, and had taken command of the Fifteenth Regiment, comprising ten companies, recruited in Worcester and the towns of the county, which, since the 28th of June, had been encamped on the Brooks Farm, near South Worcester, the place being known then and for years after as Camp Scott. The regiment was busily occupied with the work of organization, discipline and instruction, under the command of Lieutenant-Colonel George H. Ward, a capable and hard-working officer. This regiment was composed of the stanchest material, the sturdy yeomen and mechanics of Worcester County. Except the colonel, the surgeons and the chaplain, there was scarcely a professional man in the regi-

ment, commissioned or enlisted. Colonel Devens took command June 26th. As the military plans of the commander-in-chief did not call for large and rapid additions to the force already assembled near Washington, and as this regiment was composed for the most part of officers and men who had the whole duty of the soldier to learn, not having yet been even in the militia service, it was the original purpose to retain them in their camp of instruction for two months longer. But the result of the battle of Bull Run changed the plans of campaign. The army was to be reorganized by General McClellan, and troops were hurried forward to Washington from all quarters.

On August 8th the Fifteenth left the city, having received the day before a beautiful flag at the hands of the Hon. George F. Hoar, as a gift from the ladies of Worcester. Mr. Hoar's speech in presenting the flag and Colonel Devens' remarks in accepting it were eloquent and affecting. The Fifteenth passed through Baltimore near midnight of the 10th of August. The streets were thronged with people, many of them sullen and defiant in manner, but quiet. They did not want a lesson in deportment from the men of those ten great companies, a full thousand in line, all told, who marched steadily and swiftly through the streets in that hot summer night, with their muskets loaded and their ranks as firm and well closed as if they were marching in review. The accidental discharge of one of the soldier's muskets caused a momentary apprehension that the Baltimore mob would have a lesson, but nothing came of it. The next day the regiment arrived in Washington, and as it marched up Pennsylvania Avenue by company front, with alert and martial tread, its long company lines, with one hundred men in each, filling that spacious avenue from curb to curb, with the National and State colors waving in the summer air and the muskets flashing bright in the August sun, the Fifteenth presented a spectacle such as Washington, even in those days of military activity, had seldom seen.

From Washington the regiment marched, a few days later, to Poolesville, a little Maryland village, about half-way to Harper's Ferry, and there came under the command of General Charles P. Stone, who was forming a corps of observation for the Upper Potomac. With daily drills and the routine duties of camp life, varied by picket duty at the river, the time passed until October 21st, when the regiment first met the enemy and showed by the trial of battle of what stuff its soldiers were made.

I cannot here describe the battle in detail or discuss the causes of the disaster in which it ended. Briefly, General Stone was apprised by General McClellan of certain operations of the right wing of the Army of the Potomac, and was directed to reconnoitre the enemy's position at Leesburg, on the Virginia side of the river, opposite the station of the

Fifteenth. A scouting party having reported a small camp of the enemy between Leesburg and the river, and a mile or two from either, Colonel Devens was directed with five companies of his regiment to cross the Potomac on the night of the 20th, surprise this camp, if possible, and then reconnoitre in the direction of Leesburg. The remaining five companies, under the command of Lieutenant-Colonel Ward, were to march to the river and be prepared to support Colonel Devens if necessary. Some companies of the Nineteenth and Twentieth Massachusetts and a portion of Baker's California regiment were also ordered to the river in the morning. Colonel Devens found that the scouts had been deceived and that there was no camp where he expected to find one. Reconnoitering cautiously toward Leesburg in the early morning, he encountered a troop of cavalry with which he had a short skirmish, and then fell back toward the river.

Lieutenant-Colonel Ward, hearing the firing, hurried his battalion across the river to reinforce Devens. In the river at this point was Harrison's Island, about a mile long, which delayed and embarrassed the crossing. The river was much too deep to be forded; the boats provided were few and small; not more than a company at a time could be transported, and it was necessary to cross the Maryland arm of the river, then march across the island and embark again for the Virginia shore. The landing was at the foot of a steep bluff; along the face of this ran a narrow, crooked trail, up which men could scramble with difficulty. Colonel Ward's battalion arrived at the top of the bluff a little before noon, and moved forward at once across an open field of a few acres surrounded by wood to join Devens, who was still skirmishing with the enemy. After the regiment was united the firing ceased for a short time, but a brisk attack was soon made upon our position, and easily repulsed. The regiment then fell back to the bluff and there found that the portions of regiments already mentioned had arrived and also three pieces of artillery—a twelve-pound rifle-gun and two light howitzers. Colonel Baker took command by seniority of commission and formed his line of battle with the Fifteenth on the right and his own regiment on the left. Colonel Cogswell came up soon after with two companies of his, known as the Tammany Regiment. During nearly the whole of the action the enemy were concealed in the woods in the front and on the flanks of the Union force, which they considerably outnumbered. A scattering fire of skirmishers and sharp-shooters had been going on for some time, when about two o'clock the regiment forming the enemy's left wing opened the action with a volley which silenced the light guns in front of the position of the Fifteenth, killing or disabling almost every man serving them. They had been discharged not more than twice.

One incident of the battle deserves mention as

illustrating the steadiness of these Worcester County boys under fire for the first time: While the Fifteenth was exchanging a sharp fire with the rebels in its front a small force of the enemy, under cover of the woods, passed around its flank and opened fire from the rear. The line did not waver, but at the word of command faced "about," charged into the woods, dispersed the force attacking from that direction and then returned to its former position and renewed the fight with the enemy in front. The steadiness which this unexpected and most alarming attack did not shake would have been creditable to veteran troops of any army.

Toward the close of the afternoon the right wing was drawn in and the Fifteenth took position at what had been the centre of the line, and another vigorous attempt was made to drive the rebels from their position. By this time Colonel Baker had been killed and Colonel Cogswell had assumed command. The ammunition of our men was exhausted; the rebel fire continued. Further resistance seemed hopeless, and Colonel Cogswell directed Colonel Devens to retreat. "Will you please repeat the order in the presence of my major?" said Devens. Major Kimball was called up (Lieutenant-Colonel Ward having some time before been carried from the field severely wounded) and the order was repeated and obeyed. The regiment fell back to the river-bank, where some were shot by the enemy from above, some escaped across the river, some were drowned and some were shot in attempting to cross, and the remainder were taken prisoners. To whatever causes the disaster may have been due, it was not the fault of the soldiers of the Fifteenth, whose valor and steadiness could not have been surpassed. They saw many greater battles in the three following years, but it is not too much to say of them, on their first battle-field, that they would have gone anywhere and done anything that could have been expected of veteran troops in the highest state of efficiency. They would then have attempted some things which they would not, after three years of experience had taught them the limitations of military achievement.

The Fifteenth Regiment went into action with six hundred and twenty-one men. The killed, wounded and missing were three hundred and ten. Among the killed was John William Grout, second lieutenant, from Worcester. Lieutenant-Colonel Ward was wounded; Captain Studley, of Worcester, was taken prisoner. This engagement has been described at some length, because it was the first in which Worcester men met the enemy in battle. The news from the regiment caused a great sensation in Worcester. Public meetings were held to express the general admiration for the prowess of the regiment and sorrow for its losses. Energetic efforts were made to supply, by enlistments, the places of the fallen and captured and to make good the losses of clothing and personal equipment. Letters of applause, sympathy and en-

*Henry C. Smith*

couragement were received in great numbers from friends in Worcester and elsewhere, and the valor of the regiment and its commander received fitting official commendation.

Other incidents of the war must be mentioned more briefly. The next regiment organized in Worcester was the Twenty-first, composed of men recruited chiefly in Worcester County, though companies raised in Springfield, Pittsfield and Belchertown were also included in it. Its camp, on the grounds of the Agricultural Society and named Camp Lincoln, was first occupied by six companies on the 19th of July. Its colonel was Augustus Morse. It had one Worcester company, commanded by Captain B. Frank Rogers. This regiment marched for the front August 23d. Within a month Governor Andrew authorized Edwin Upton as colonel and A. B. R. Sprague as lieutenant-colonel to raise another regiment in Worcester. Recruiting was begun about the middle of September, and on the last day of October, with full ranks, armed and equipped, the regiment, designated as the Twenty-fifth, left Worcester for the seat of war. This regiment, more than any other, was then and has since been regarded as the Worcester Regiment. Seven of its ten companies were recruited in the city; the other three in Milford, Fitchburg and Templeton, respectively. It was a splendid regiment of stout-hearted, intelligent, faithful men, and it could be matched by few in the service for the cheerful heroism and gallantry of its soldiers, their hardships, labors and losses in action. These two regiments, the Twenty-first and Twenty-fifth, were assigned to the expedition destined to operate in North Carolina, under the command of General Burnside. Early in the year 1862 they were engaged with great credit in the capture of Roanoke Island and Newbern. The Fifteenth lay at Poolesville all winter. In March, after a short and unimportant advance by way of Harper's Ferry up the Shenandoah Valley, the regiment, as a part of the Army of the Potomac, embarked at Alexandria for the momentous Peninsula Campaign under General McClellan. It fought bravely at Yorktown, Fair Oaks, the seven days' battles before Richmond and returned to the vicinity of Washington in season to take part in the unfortunate campaign of General Pope. In September the Fifteenth was again at the front in the great battle of Antietam and suffered terribly. The number of officers and men of the Fifteenth who went into action was almost precisely the same as that of the famous Light Brigade at Balaklava. The time they were engaged was very nearly the same and the proportion of losses was almost precisely equal. On that 17th of September, at Antietam, twenty-four officers and five hundred and eighty-two enlisted men of the Fifteenth went into that murderous corner. Twenty minutes later the killed, wounded and missing numbered three hundred and forty-three. Of the killed were five officers and sixty enlisted men; wounded (one officer and many

enlisted men mortally), six officers and two hundred and forty-eight enlisted men; missing, twenty-four men. A loss of nearly three-fifths in less than half an hour is an experience that has befallen few regiments or companies.

The Twenty-first Regiment also had a period of harassing and dangerous service in the autumn and winter of 1861. Transferred from North Carolina to Virginia in August, it was engaged in Pope's campaign in the battles of the Second Bull Run, of Chantilly and later at Antietam, doing heroic and valuable service and suffering heavy losses, and in December it was in the hottest part of the battle in General Burnside's ill-planned and disastrous attack upon Fredericksburg, in which the Fifteenth, too, as usual, had a place of honor and of danger, and also, as usual, lost heavily. The loss most grievously felt was that of its heroic and devoted surgeon, Samuel Foster Haven, Jr. The Twenty-fifth during this year had been doing arduous and useful service—marching, scouting and fighting.

During the summer and fall of 1862 three more regiments were organized in Worcester,—the Thirty-fourth, Colonel George D. Wells; the Thirty-sixth, Colonel Henry Bowman, both of these for three years; and the Fifty-first, Colonel A. B. R. Sprague, for nine months. The Thirty-fourth left Worcester on the 15th of August, the Thirty-sixth on the 11th of September and the Fifty-first on the 25th of November. All of these regiments did heroic service. The Thirty-fourth, composed of companies raised in the five western counties of the State, of course, including Worcester, was noted throughout its term of service for the promptness and precision of its movements, the neatness of its quarters and its equipments, its endurance of marches and labors and its ardor and prowess in battle. These comprehend all the valuable qualities of the soldier, and it is not extravagant praise to say that the Thirty-fourth excelled in all of them. It was commanded during most of its service by Lieutenant-Colonel (afterwards Colonel) William S. Lincoln. The Thirty-sixth traversed more miles in its time of service than any other Worcester regiment. It served in Virginia, Kentucky, Tennessee, Mississippi, Tennessee, Virginia again and North Carolina. The fortunes of these regiments and others cannot be followed in detail. They were all fighting regiments, and did their full duty on such days of carnage and of fate as those which are recalled by the names of Gettysburg, the Wilderness and Cold Harbor. They endured exhausting marches and sieges, hunger, disease, wounds and the horrors of rebel prison pens. This is equally true also of other regiments raised in Worcester, or of which Worcester men formed a part, especially of the Fifty-seventh, whose frightful losses in its first engagement, that of the Wilderness, were only a prelude to a service, which, though short, compared with that of some other regiments, was splendidly heroic,

and crowded with labors and losses. Nor can I mention here the names of many of the Worcester heroes. The officers have their meed of fame in the histories of their respective regiments and in the more elaborate histories of the war. The private soldiers, who deserved as well, are too many to be designated by name here. Sergeant Thomas Plunkett, of the Twenty-first, whose arms were struck off by a fragment of shell at Fredericksburg, just as he had snatched the regimental colors from the relaxing grasp of the dying color-sergeant, must never be omitted when the deeds of Worcester's heroes are recounted. But their names are all perpetuated in the roll of honor; their memories will be fondly cherished for a few years by surviving comrades and kinsfolk and proudly treasured, let us hope, among the most precious family possessions by generations of descendants, who will admire and imitate their patriotic devotion.

Besides the regiments which were raised and organized in the city, almost every other Massachusetts regiment had Worcester men in its ranks or among its officers. A large number also in the aggregate served in the artillery, in military organizations of other States, in the regular army and in the navy. It is impossible even now to state with precision the number of men whom Worcester contributed to the War for the Union. Governor Bullock, in his address at the dedication of the soldiers' monument, estimates it at "not far from three thousand," and that seems to me a moderate statement. Yet, when we remember that it is more than one in three of the adult male population of the city at that time, the number seems almost incredible. They served in fifty regiments of infantry, five of cavalry and fourteen batteries or regiments of artillery organized under the authority of Massachusetts, and probably in fifty other military organizations. Among these Worcester soldiers were one major-general, by brevet; five brigadier-generals, by brevet; four colonels, three lieutenant-colonels, twelve majors, fifty-two captains, fifty-four first-lieutenants, fifty-three second-lieutenants, eight surgeons, four chaplains. These were all in Massachusetts organizations or received promotion while serving with Massachusetts troops. Of Worcester men serving with other troops there were five brigadier-generals, two majors, a captain and a lieutenant, besides one commodore and several lieutenants and ensigns in the navy.

This brief sketch of the military history of Worcester during the Civil War may seem to do less than justice to its subject, as of course it does. A series of volumes, instead of a single chapter, would not exhaust the theme. Names, even of those most deserving of honor, have been mentioned but rarely. It seems invidious further to distinguish by special eulogy those whose rank gave them distinction and personal advantage at the time and whose names will be perpetuated elsewhere, while thousands of obscure men, no

less daring, devoted and unselfish, laid down their lives cheerfully, unnoted, except as units in the great aggregate of patriotic sacrifice. Since the great commanders will not lack their meed of praise, let us here express our admiration and gratitude for the valor, constancy and devotion of the armies, rather than the prowess of the generals.

Even in Worcester, where courage and loyalty were as abundant as anywhere, voluntary enlistment did not supply all the enormous and exacting demands of the military service. Bounties for enlistment were offered after the first glow of patriotic ardor had cooled a little. No bounties were paid for the men, about twelve hundred in number, who enlisted in Worcester under the President's call for volunteers in 1861. But in 1862 the city paid a bounty of one hundred dollars for each volunteer. In 1863 the draft was ordered under an act of Congress, and Captain Samuel V. Stone was appointed provost marshal for the Eighth Congressional District, with headquarters at Worcester, to enforce it. No disturbances took place here while the draft was in progress. Precautions wisely taken to prevent or suppress disorders happily proved unnecessary, or so completely successful as to seem superfluous. Of the men drafted in Worcester, 103 paid the commutation fixed by the law, 53 furnished substitutes, 59 enrolled citizens supplied substitutes before the draft was made. The amount paid by the city and by citizens for bounties and recruiting is estimated at nearly two hundred and fifty thousand dollars, and the sums paid by individuals for commutation and for substitutes under the draft was nearly one hundred thousand dollars more. In order to ascertain the price in money, besides the cost in blood and sorrow, which Worcester paid for the Union, must be added to this the sums contributed to the Soldiers' Relief Committee, to the Sanitary and Christian Commissions, and to various other forms of military charities, and the city's share of the State bounties and State aid to soldiers and their families, which still continues under the nobly generous, yet wisely-guarded regulations prescribed by State laws; and lastly, Worcester's contributions to the national revenues expended in the prosecution of the war, the payment of the debt and the annual cost of pensions, of which latter sum alone, Worcester pays, without realizing it, not less than one hundred and fifty thousand dollars annually. Truly with a great price we vindicated our title to the precious inheritance of national union.

The oldest of the militia companies now existing here is still known by the name given it in its original charter by a special act of the General Court in 1804, the Worcester Light Infantry. It was preceded in point of time by the Worcester Artillery, which appears to have been organized in 1783. Its organization was maintained until the autumn of 1838, when the last entry on its record is "Company disbanded and officers discharged." Both these companies offered their services in the War of 1812 with Great Britain,

and the town voted bounties for enlistments, but the Governor declined to comply with the President's requisitions for troops, alleging some constitutional objections, and the Worcester troops were not then called to the field. Two years later, however, when the aspect of the war had become more serious, Governor Strong ordered the militia of the State to be in readiness for active service. Two companies of militia were drafted from the county and served in the forts in Boston harbor, and a little later the Light Infantry, and the Artillery marched to the seaboard, and were stationed at South Boston for about six weeks, being discharged on the 31st of October. The Light Infantry as a company of the Sixth Regiment, promptly answered the call of the President, and was among the foremost of military organizations to arrive at the national capital at a critical moment, as already narrated. At the end of the three months' service the Light Infantry returned to Worcester. A large number of its members enlisted or were commissioned in other commands.

The City Guards, organized in 1840, was for many years designated as light infantry, but afterwards became a rifle company, and was attached to the Third Battalion of Rifles, in the State militia. As such it was called into the three months' service with the battalion. The Emmet Guards, organized as a company of the State militia after the first note of civil war had sounded, were also attached to the Third Battalion of Rifles. The two former of these companies, upon being mustered out of the service of the United States, maintained their existence in some form, and upon the reorganization of the State militia, after the war, were re-established and assigned to regiments, in which they have maintained a high reputation for soldierly bearing, discipline and efficiency. The Emmet Guards in 1888 were organized anew and accepted by the Governor for the State service. They are not surpassed for the exact performance of all military duty and for precision and smartness in drill.

The artillery company known as "Battery B" was formed in Worcester at the reorganization of the militia after the war. It has had a succession of competent and zealous commanders, and has been often complimented by superior officers for proficiency in artillery exercises, the admirable condition of its arms and equipments and its evident readiness for any service.

Immediately after the departure of the city militia companies for the seat of war in April, 1861, the honorary and past members of the Light Infantry and the City Guards organized each a company by itself as a Home Guard, and with the intention also of maintaining an active list of volunteers, from whom the ranks of the parent companies in the field might be recruited from time to time. These companies performed various service, at military funerals, as escorts on occasions of public ceremony and as a reserve

force in case of threatened public disorder, until the organization of the State Guard, in June, 1863, under the authority of a law of that year. The State Guard, besides the functions of parade and ceremony, which militia companies are often called upon to discharge, performed duties of real value in preserving the peace of the city, which was endangered, though happily not greatly disturbed, by the elements of discontent and mischief introduced by the bounty and substitute systems of recruiting, and stimulated to an alarming activity by the example of the draft riots in New York and elsewhere. Members of the Guard were detailed for guard duty under the orders of the provost marshal, and the whole company was, in the latter part of July, 1863, on duty for several days at the provost marshal's command, guarding drafted men, preserving the peace of the city and escorting a body of conscripts to the rendezvous at Boston. The State Guard ceased to be a part of the militia of Massachusetts by the repeal, in 1866, of the act under which the company was established. Its existence was maintained, however, as a voluntary organization, and in the next year the Legislature granted the petition of its members for a special charter, under which the company was maintained for several years and for a time was organized as a battalion of two companies.

Thus we close this outline of Worcester's military history. The community has cultivated the arts of peace with signal success, but has never shrunk from doing its whole duty when honor and patriotism called for the labors and sacrifices of war. Her sons were daring, patient and skilled in military arts. These were their qualities from the times when Ephraim Curtis, of Worcester, brought relief to the sorely-beset garrison of Brookfield, and when, a century later, Timothy Bigelow, of Worcester, led his command in that terrible winter march through the wilderness of Maine and Canada, and hurled them in a hopeless assault against the impregnable fortress of Quebec, to that time, after almost another century, when Charles Devens, commanding, by a happy coincidence, another Fifteenth Regiment, made his heroic stand on the banks of the Potomac at Ball's Bluff. And while the men of Worcester marched and fought and died, the women of Worcester, with a constancy and patience deserving of all reverence, suffering the pangs of anxiety and sorrow, toiled and saved to alleviate the lot of their husbands, sons and brothers. Our people may claim as appropriate to their own community, the motto of the older Worcester in England, "A City Faithful in War and Peace."

## CHAPTER CXCI.

WORCESTER—(*Continued.*)

## MANUFACTURING AND MECHANICAL INDUSTRIES.

BY CHARLES G. WASHBURN, A.B.

*Early Encouragement of Manufactures—Saw and Grist-Mill—The Silver-Mine—Potash—Timothy Bigelow—Early Manufacture of Cloth—Paper-Mills—Character of Business prior to 1820—Trades-people Discontented with the Heavy Taxes—Public Men appear in Home-made Cloth—Worcester Honorable Society—The First Exhibition of the Worcester Agricultural Society.*

I am indebted to the American Antiquarian Society for access to its valuable collection of books, pamphlets, newspapers and manuscripts, and to Mr. Edmund M. Barton, the librarian, for many courtesies. I have drawn freely from the files of the *Spy* and make the acknowledgment here to save frequent repetition in the text.

C. G. W.

AFTER the first settlement of Worcester had been broken up by the Indians in King Philip's War, a meeting of those interested was held at Cambridge, March 14, 1679, N.S., for the purpose of considering the expediency of again settling the town.<sup>1</sup>

As a result of this meeting, it was resolved "to settle the said plantation some time the next summer come twelve months, which shall be in the year of our Lord 1680."

The town was to be built to attain six ends, which were enumerated, chief among them "the better conveniency of attending God's worship," and the "better education of their children;" but provision was also to be made "for the better accommodation of trades-people."

Nothing of a practical kind was done looking toward the settlement until the General Court threatened to forfeit the grant unless the settlement were made; accordingly, an agreement was entered into April 24, 1684, with that end in view. It was voted that the plantation be divided into four hundred and eighty lots, three of these to be set apart for the maintenance of a saw-mill, and three for a grist-mill.

To the builders and maintainers of works promoting useful trades, and for a fulling-mill, when the place is capable thereof, six lots.

The histories appear to agree that Captain John Wing built the first mills in Worcester, some time in 1685, perhaps in the month of March; he probably had both a saw and grist-mill located on the north of Lincoln Square, on Mill Brook, about where the Nashua freight depot is now situated.

Captain Wing appears to have been a man of considerable consequence. He was a resident of Boston, one of the founders of the Old South Church, an officer in the artillery company and kept the Castle Tavern. He was a member of the committee having charge of the plantation of Quinsigamond, and became

a large landholder there, conducting his mill in Worcester and his tavern in Boston at the same time. He died in 1702.<sup>2</sup>

From 1686 till the fall of 1713 no records appear of the transactions which took place in the settlement, and during a great part of that time the country was exposed to the ravages of the Indians, and, in consequence, the town was almost entirely deserted.

The third attempt to effect a permanent settlement was made in October, 1713; the old saw-mill of Wing appears under the ownership of Thomas Palmer, Cornelius Waldo, of Boston, and John Oulton, of Marblehead.

The next mill to be built was that of Obadiah Ward, which he devised to his son in his will dated December 16, 1717. It was near the upper canal-lock, present site of Crompton's Loom Works.<sup>3</sup>

Elijah Chase built the first corn-mill, near where the Quinsigamond Paper-Mills were afterwards erected on the Blackstone River. The water privilege, with thirty acres of land at Quinsigamond, was granted by the town to Captain Nathaniel Jones, September 12, 1717, upon condition that he should complete and maintain a grist-mill for twelve years. He built a dam and saw-mill in 1726, but both were probably swept away in the flood of 1728-29, and in 1732 the town took steps to recover the land by reason of the failure of Jones to comply with his contract.<sup>4</sup> The mills in Worcester at this early period were few in number and simple in character. Saw and grist-mills, with an occasional fulling-mill and trip-hammer shop, were to be found; certainly the demands of two hundred people could not have been very great.

In 1754, according to a description found in Lincoln's "History,"<sup>5</sup> "a vein of metal, which was supposed to be silver, was discovered near the head of the valley, about a mile north of the town. A company for exploring the spot was formed by some of the most substantial inhabitants, furnaces and smelting-houses were erected and a cunning German employed as superintendent. Under his direction a shaft was sunk eighty feet perpendicularly, and a horizontal gallery extended about as far through the rock, which was to be intersected by another shaft, commenced about six rods north of the first opening.

"Among the masses which were, within a few years, laid around the scene of operations were specimens of the ores containing minute portions of silver, specks of copper and lead, much iron and an extraordinary quantity of arsenic; when struck against steel a profusion of vivid sparks were thrown out, and a peculiarly disagreeable odor of the latter mineral emitted. On the application of heat this perfume increased to

<sup>1</sup> Lincoln, p. 33.

an overpowering extent. The company expended great sums in blasting the rocks, raising its fragments and erecting buildings and machinery. While the pile of stone increased, the money of the partners diminished. The furnaces in full blast produced nothing but suffocating vapors, curling over the flames in those beautiful coronets of smoke which still attend the attempt to melt the ore.

"The shrewd foreigner, in whose promises his associates seem to have placed that confidence which honest men often repose in the declarations of knaves, became satisfied that the crisis was approaching when it would be ascertained that the funds were exhausted and that stone and iron could not be transmuted to gold. Some papers which exist indicate that he pretended to knowledge in the occult sciences as well as skill in the art of deception; however this may be, he assured the company that the great enemy of man had been busy in defeating their exertions, making his presence redolent in the perfume of sulphur and arsenic. He obtained the sum of \$100 and made a journey to Philadelphia to consult with a person experienced in mines and their demons, for the purpose of exorcising the unsavory spirit of the crucible. He departed with a barrel full of the productions of the mine, but never returned to state the results of his conference.

"The proprietors abandoned the work when they were by the reality of the loss from the dream of fortune, and afterwards destroyed the records of their credulity.

"The spot is easily found. Follow the Nashua Railroad north on foot from its crossing on Mill Brook till you pass the two-mile post. The deserted shaft is about twenty rods to the northeast of this spot. It is readily found, as a pile of slate and stones still lie where they were thrown out by the miners on a slight eminence in the meadow."<sup>1</sup>

And yet the German superintendent may have been more superstitious than knavish. The mineral which baffled him, whose arsenical fumes almost suffocated his miners and confirmed his belief in the supernatural, was cobalt, a name derived from Greek *Kobalos*, German *Kobold*, a little devil. German folk-lore is full of the diabolical pranks of the Kobold, and of pity for the unfortunate beings who suffered from the tortures which he inflicted to prevent incursions upon his subterranean dwelling.

POTASH.—In 1760 the manufacture of potash appears to have been carried on quite extensively in and about Worcester; indeed, it was a thriving industry throughout the country. By reason of its scarcity in England, Parliament remitted the duties in 1751, and encouraged its importation from the colonies, where wood was plentiful. Numerous pamphlets upon the desirability of this branch of manufacture

to the colonies, and upon the best methods of making potash, were at this time published.

Its manufacture was urged on the ground of affording the colonies an article of export with which to pay for the manufactures imported from Great Britain, and the North American plantations were thought to be well adapted to the manufacture of potash by reason of the abundance of wood suitable for the purpose. A writer upon this subject, in 1767, makes the following recommendations:

It is supposed that each set of works for carrying on the manufacture of potash will have a range of ten miles round for its supply, less than which would not be sufficient; and I would here, by the way, caution such who may undertake to erect works for this purpose, that the place they fix upon be at least twenty miles distant from any other works of the like kind, lest they only injure their enterprise by thus cutting off the prospect of a sufficient supply of ashes.

Each set of works under such advantages of obtaining stock will, I presume, at the least, annually produce twenty tons of good potash, which, at the lowest rate it has ever been sold for, namely, £25, would amount to £500 sterling, and if twenty of these works were to be erected within the limits of the province of Massachusetts (which I think a moderate number), there might be annually exported out of the province alone 400 tons of potash, which, at the before-mentioned low rate, would amount to £10,000 sterling.<sup>2</sup>

The process of manufacture was simple, and consisted in treating wood-ashes with water until the potash contained in them was exhausted, and from the lye thus made a salt was obtained by evaporation. The woods chiefly employed in making potash were hickory, oak, beech, birch, elm, walnut, chestnut and maple. Woods like evergreen, or that abound in turpentine, were avoided.

Worcester appears to have been well supplied with wood, and works for the manufacture of potash were established in different parts of the town. Pleasant Street was at one time known as Potash Hill. Lincoln, in his history, says: "Works for making potash were first established in the north part of the town about 1760; buildings for similar purposes were placed on the west side of Lincoln Street, a little above the old Hancock Arms Tavern, by John Nazro, about ten years after; four more were established at much later periods."

Peter Whitney, in his history, published in 1793, says: "The first complete ton of potash was sent to market from the neighboring town of Ashburnham, where it was made at the time of the settlement in 1735." In 1788 there were about two hundred and fifty potash works in Massachusetts. Governor Bowdoin, as a remedy for the distress then prevailing, had recommended in a message to the General Court, 1785, that the farmers in towns where there was an abundance of wood to be cleared away, should devote themselves to the production of potash and pearl-ash, and the ashes should be deposited with the State agent, who should sell them and use the money to pay the taxes of the men who brought them.

<sup>2</sup> John Mascarence's address to His Excellency, Thomas Pownall, Esq., captain-general and Governor-in-chief in and over His Majesty's province of Massachusetts Bay in New England.

<sup>1</sup> "The Heart of the Commonwealth," Henry J. Howland, 1856.

Isaiah Thomas, in 1793, advertised a book on the manufacture of pot and pearl-ash.

It has seemed worth while to dwell at some length upon the manufacture of potash, as it so clearly shows the narrow resources of the provinces at that time, and the lack of any manufacturing interests beyond the simplest kinds designed to meet the wants of a scanty population.

**TIMOTHY BIGELOW.**—One of the earliest mechanics to attain prominence in Worcester was Timothy Bigelow, who, before the Revolution, had a blacksmith's shop where the Court Mills afterwards stood, near the present junction of Union Street with Lincoln Square. Of him a somewhat romantic story is told.

There then stood on the site of the block of brick houses, opposite the court-houses, the residence of the orphan daughter of Samuel Andrews, then the principal heiress in Worcester. To quote from an old newspaper story:<sup>1</sup>

"In the rear of the Andrews home Tim Bigelow had a blacksmith's shop, where he blew the bellows, heated and hammered the iron, and shod the horses and oxen and mended the plows and chains for the farmers of the country about him. Now Tim was as bright as a button, more than six feet high, straight and handsome, and walked upon the earth with a natural air and grace that was quite captivating. Now Tim saw Anna, and Anna saw Tim, and they were well satisfied with each other; but, as he was then 'nothing but Tim Bigelow, the blacksmith,' the lady's friends, whose ward she was, would not give their consent to a marriage. So, watching an opportunity, the lovers mounted fleet horses and rode a hundred miles, to Hampton, in New Hampshire, which lies on the coast, between Newburyport and Portsmouth, and was at that time the 'Gretna Green' for all young men and maidens for whom true love did not run a smooth course in Massachusetts. They came back to Worcester as Mr. and Mrs. Timothy Bigelow.

"He was a man of decided talent, and well fitted by nature for a popular leader. All the leading men of the town at that time were Tories. He espoused the cause of the people, and soon had a party strong enough to control the town, and, being known as a patriot, he was recognized by Hancock, Samuel Adams, General Warren, James Otis and others of the patriot party throughout the Province. He was sent as a delegate from Worcester to the Provincial Congress, and, as captain of the minute-men, he led his company from Worcester to Cambridge on the 19th of April, 1775, at the summons of a messenger, who rode swiftly into town that day on a large white horse, announcing that war had begun.

"Blacksmith Bigelow soon rose to the rank of major, and, afterwards, to that of colonel of the Fif-

teenth Massachusetts Regiment, which was composed almost exclusively of Worcester County men. He was at the storming of Quebec, at the taking of Burgoyne, at the terrific scenes of Valley Forge and on almost every other field made memorable by the fierce conflicts of the Revolution.

"When the war was over he returned home, his constitution shattered by hard service for his country, his health ruined, his fortune gone in consequence of the formidable depreciation of the currency, under which forty dollars was scarcely sufficient to pay for a pair of shoes."

**CLOTH.**—In 1789 a few men formed an association for the purpose of manufacturing cloths, that had theretofore been imported from Great Britain, and in the *Spy* of April 30, 1789, the following notice is found:

On Tuesday last the first piece of corduroy made at a manufactory in this town was taken from the loom; and March 25, 1790, the proprietors of the Worcester Cotton Manufactory gave notice that they would not take any more linen yarn for the present, having a sufficient quantity on hand.

May 27, 1790, Samuel Brazer advertises "goods of American manufacture to be sold at wholesale and retail, corduroys, jeans, fustians, federal rib, and cotton, for cash only. The prices are reasonable, the quality of the goods superior to those imported, which will induce all to give preference to the manufactures of their own country." Later, we find:

An Overseer wanted at the Cotton Manufactory at Worcester, also three or four healthy boys as apprentices; two or three journeymen weavers at said manufactory. Apply, for further information, to Saml. Brazer or Daniel Waldo, Worcester.

August 5, 1790, all persons who had demands against the proprietors of the Worcester Cotton Manufactory were requested to present them to Samuel Brazer and Daniel Waldo, Jr., from which we conclude that the enterprise had not prospered, and it is probable that upon the declaration of peace, goods could be obtained more cheaply from England than they could be manufactured here.

This factory, containing crude machinery, stood upon Mill Brook, and was located in School Street, east of the present location of Union Street.

When the manufacture of corduroys and fustians was abandoned, the factory was moved to Main Street, and was thereafter known as the Green store (present site of Parker block). Samuel Brazer was from Charlestown, where he was a baker, and in 1782 engaged in the same business in Worcester; he appears to have been somewhat jealous of his good name, for in 1784 we find him refuting a slander in regard to the size of his bread. In October, 1785, he dealt in crockery and West India goods at the sign of The Old Maid, in the centre of the town. From this time on Mr. Brazer was engaged in a variety of occupations.

Daniel Waldo, Jr., who was associated with Samuel Brazer in the manufacture of corduroys, was a son of Daniel Waldo, who moved to Worcester from Lancas-

<sup>1</sup> "Carl's Tour in Main Street."

ter in 1782, and engaged in the hardware business near the bridge over Mill Brook at Lincoln Square.

**PAPER-MILLS.**—The manufacture of paper took an early and prominent place among the industries of the Colonies.

May 3, 1775, at a convention of delegates from towns in Worcester County, the following vote was passed :

*Resolved*, That the erection of a Paper-mill in this county would be of great public advantage, and if any person or persons will undertake the erection of such a mill and the manufacture of paper, that it be recommended to the people of the county to encourage the undertaking by generous contributions and subscriptions.

In the *Spy* of July 5, 1775, the following notice is found :

Any person or persons that incline to set up that useful manufacture, the making of paper, may hear of one who will undertake to give directions for building a mill, and will carry on the business in good shape with assistance.

From the pamphlet on "Early Paper Mills in Massachusetts," by Mr. E. B. Crane, and part of the Proceedings of the Worcester Society of Antiquity for 1886, we learn that Mr. Abijah Burbank, of Sutton, was the first to respond to this resolution.

Paper was evidently very scarce, for we find that for want of it but one-half of the *Spy* could be published October 30, 1776. This was no doubt due to the scarcity of rags, which evidently continued for some time, for on October 30, 1777, the following notice was published :

The paper-mills and, of consequence, the printing offices in this county must inevitably stop unless the good people are more careful in preserving their rags. The advanced price of 3d. per lb. for clean linen rags is now given by the printers, which, together with the invaluable benefit which the public must derive from having a plentiful supply of paper books, cannot fail of the desired effect.

This difficulty seems, however, to have been overcome, for in May, 1778, Mr. Burbank advertised,— "The manufacture of paper in Sutton is now carried on to great perfection."

The business of Isaiah Thomas as printer and publisher in Worcester had become of considerable consequence. The Rev. Peter Whitney stated that no person had added more to the consequence and advantages of the town and county of Worcester than Isaiah Thomas. The publishing of the *Spy* was only a part of his business. After the war, in 1788, he conducted a printing-office in Boston and in Worcester, and carried on a large business as printer, publisher, bookseller and bookbinder.

Mr. Thomas lived on the site of the stone court-house, just south of which his office was located. He employed in the various departments of his business one hundred and fifty hands.

To provide paper for his needs, Mr. Thomas, to quote from Mr. Crane's pamphlet, "presumably with the intention of erecting a paper-mill, on January 7, 1785, purchased of Ephraim McFarland, for ninety pounds, the southerly half of a dam and water privilege located at what is now known as Quinsigamond village, and on the northerly side of the street,

in front of the site now occupied by the Washburn & Moen Manufacturing Company's Mills.

"Owing, perhaps, partly to the unsettled condition of the affairs of state, and to the impoverished plight of the country, the building of the mill was deferred, and November 9, 1787, he sold the property for eighty-five pounds to Dr. Elijah Dix, from whom he again purchased it January 31, 1793, for one hundred pounds, and soon began the construction of a two-vat mill"; and, to again quote from Mr. Crane, "This mill, built by Mr. Thomas, was supplied with two vats of about one hundred and ten lbs. capacity, and they ran usually fifteen hours each day, employing ten men and eleven girls. The main product of this mill was hand-made paper, and from twelve hundred to fourteen hundred lbs. were turned out weekly." As to price of labor: The skilled engineer received about three dollars per week, vat-men and coucher three and a half dollars each without board; ordinary workmen and girls, seventy-five cents per week each; boys, sixty cents each, and they were given board.

It was here at this mill that Mr. Zenas Crane, a native of Dorchester, toiled at the trade of paper-making for several years previous to the summer of 1799, when he set out from Worcester to establish, in company with Henry Wiswell and Daniel Gilbert, a paper-mill in the western portion of Massachusetts, and succeeded so admirably in laying the foundations for a business that, through the careful and skillful management of Mr. Crane and his descendants, has assumed the most flattering proportions, and whose trade-marks, known as "The Old Berkshire," "Old Red Mill," "Pioneer Mill" and "Government Mill," stand for as good an article of paper as can be found in this country or perhaps any other.

Mr. Thomas sold his paper-mill to Caleb and Elijah Burbank, of Sutton, February 24, 1798. This paper-mill was the second in the county and the eighth in the State. Another building was erected shortly after 1811, below the Thomas Mill, and used as a sickle-factory by Gardner Burbank, Elijah's son; afterwards it was converted into a paper-mill. This building was located in what is now the scrap-yard of the Washburn & Moen Manufacturing Company.

In 1778 the principal articles, aside from food and the ruder kinds of cloth, were imported, and mostly from England. The resident of Worcester could find steel, bar iron, choice brandy, New England and West Indian rum, coffee, alum, brimstone, powder and shot at the store of Samuel & Stephen Salisbury, on the north side of Lincoln Square, just east of the Salisbury mansion, where the depot now stands.

Elisha Clark, at this time, followed the business of rope-making about two miles from the meeting-house, on the road to Sutton.

Clock and watch-work was done in a small way, but not of a very fine grade, if we may judge from the following description of a watch supposed to have been stolen: "A large old-fashioned watch with the

glass broken in three places and put together with putty."

As a rule, shoemakers in the early days went from house to house, but in 1779 Nathan Heard appears to have established a small shoemaker's shop in Worcester.

Daniel Waldo, to whom reference has been made, opened, in 1782, a store near the bridge over Mill Brook at Lincoln Square, where he offered for sale best Heart and Club German steel, bar iron, 4dy. and 10dy. nails, window-glass, Dutch looking-glasses, iron shovels, spades, saddlers' ware, and in general, an assortment of hardware and West India goods, choice Bohea tea, etc.

The firm of D. Waldo & Son, dissolved December 31, 1791; Daniel Waldo, Jr., continued.

In 1783, Abel Stowell manufactured clocks and watches in his shop south of the meeting-house, on the west corner of Park and Salem Streets. He made in 1800 the clock formerly in the Old South Church. The business of watch and clock-making appears to have been a considerable industry at this time. Benjamin Willard, of Grafton, who had an office with Isaiah Thomas, had sold two hundred and fifty-three eight-day clocks up to 1784.

The art of hat-making was early practiced in Worcester; John Smith offered one shilling each for cat-skins in 1782, and in 1789 Nathan Blackburn advertises for an apprentice in the hat-making business.

In 1789 Palmer & Daniel Goulding owned a tannery. Almost every town had a tan-yard, and leather of sufficiently good quality was made to serve the needs of the shoemakers and saddlers in the immediate vicinity.

Improvements in the simple conveniences for living were made from time to time, and in 1791 the appreciation of the necessity for a cheap and satisfactory artificial light is found in the construction of a new candle machine,—price, forty-five dollars,—with which it was claimed a boy could make three hundred and sixty rods of candles per day.

Abraham Lincoln had a trip-hammer and grist-mill a few rods from the court-house, which he offered for sale in 1795. It must have been located on Mill Brook. The works are described as containing two pairs of bellows that go by water, a grindstone and mill all under one roof; "said works and grist-mill are as convenient and as well situated for custom as perhaps any in the Commonwealth."

The desire for communication between the seaboard and Worcester appears to have been felt previous to March, 1796, when some persons formed an association at Providence for making a canal to Worcester, and they were at that time invited to a conference in Worcester at the tavern of Ephraim Mower. Later on, no doubt as a result of this meeting, a prospectus appeared setting forth the purpose of the Canal Company, which was to issue four thousand shares of stock, at one hundred dollars each, which

it was estimated would cover the cost of building the canal. Subscriptions were solicited in Worcester; William Paine (at Dr. Lincoln's store), Joseph Allen (at his office), Isaiah Thomas, Thomas Payson, Daniel Waldo, Jr., and Samuel Chandler were appointed to receive them.

In October, 1796, a number of individuals petitioned the General Court for an act of incorporation for the purpose of cutting a canal from Great Pond in Worcester to Boston, but nothing was done at this time either with the Blackstone Canal or with the proposed canal to Boston. In 1822 surveys were made for the Blackstone Canal, which was afterwards put into successful operation, as appears later in the narrative.

In 1798 Daniel Denny had a card-factory on Mechanic Street near Main, opposite Mower's tavern (present site of Walker's building); later, he moved to Main Street, opposite present site of Bay State House. He, no doubt, bought his wire of Daniel Waldo, who imported it, and who, at this time, announced "Sixteen casks of Wool and Cotton Card wire will be landed in a few days from the brigantine 'Aidar,' just arrived from Amsterdam."

Dutch plows, made in Connecticut, were at this time for sale at Denny's store.

Cornelius Stowell, the clothier, had, in 1785, a shop on the east corner of Park and Orange Streets. Abel (the clock-maker), Peter and Ebenezer were his sons. The two latter he took into partnership with him about 1790, when they began to manufacture woolen goods, print calicoes, carpets, dye and dress woolen goods. They had two fulling-mills, and dyed fine scarlet and deep blue colors in the best manner.

In 1804 Peter & Ebenezer Stowell commenced to weave fine carpets, and at one time had six looms of their own invention and construction in operation. They made the first carpets used in the State-house at Boston. July 19, 1809, a patent on wood screws was granted to Abel Stowell, and in January, 1816, he and his son were located on the Common, a few rods southwest of the Baptist meeting-house, where they conducted a miscellaneous business, dealing in stoves of cast and sheet iron, with their funnels, "as cheap as they can be purchased in Boston or any other place." Machinery of all kinds in brass and iron, particularly such as are used in carding and other factories; clocks for meeting-houses and printers' materials in iron and brass. Among his effects offered for sale by his administrators in May, 1819, was an undivided part of what is called the Black Lead Mine, consisting of two acres. This was, no doubt, what was later known as the Worcester Coal Mine. Black lead was procured here and ground into a paint, which was quite generally used.

In January, 1808, Curtis & Goddard were busy making chaises, and at this time appear to have moved from opposite the jail to a building south of

the bank. Samuel Newhall had taken the noted stand of John Johnson, where he intended carrying on the soap-making business. Thomas Stevens, cabinet-maker, states that he has purchased the right to make and sell two kinds of churns for several towns in the county.

In May, 1810, John Earle and Erasmus Jones erected a wool-carding machine to pick, break and card wool at the building known as Lincoln's Trip-hammer Shop, fifteen rods east of the court-house.

At this time the number and variety of manufactures in Massachusetts appear to have increased considerably. Some idea of these, in 1810, may be had from a notice issued from the marshal's office in Boston July 17th, asking for information in regard to the following industries: tanneries, distilleries, sugar refineries, breweries, paper-mills, oil-mills, snuff-mills, chocolate-mills, gunpowder-mills, glass-works, fulling-mills, carding-machines (going by water), hemp and flax spinning-mills, cotton and wool-spinning mills, rope-walks, furnaces, air furnaces, forges, bloomeries, rolling and slitting-mills, cut-nail factories, trip-hammers and steel-furnaces.

The sudden increase in the variety of manufactures may be attributed to the embargo, declared in December, 1807, and to the complications then existing between this country and France and England, which led to an almost complete stoppage of importations, and manufactories of cotton goods, woollen goods, iron, glass, pottery and other articles rapidly sprung into existence.

Previous to the embargo, according to Hildreth,<sup>1</sup> there were in the United States but fifteen cotton-mills with a total of eight thousand spindles. By the end of 1809 eighty-seven mills were built, of which sixty-two were in operation—forty-eight by water and fourteen by horse-power—working thirty-one thousand spindles, and many more were in process of erection.

Most of the saws used in Worcester in 1810 doubtless came from the works of Elijah Waters & Co., at Sutton, who kept on hand steel-plate and saw-mill saws of various sizes.

One of the earliest machine-shops in Worcester was that of Earle & Williams, in 1812, opposite the court-house, where they carried on the business of machine-making, and advertised for sale machinery for spinning cotton and wool, carding-machines, and brass castings. Their shop was destroyed by fire January 5, 1815.

In April, 1813, the attention of shoe and boot-makers is called to a new and useful improvement, secured by patent, for putting shoes and boots together with copper nails, without any sewing. The patentee announces that he will attend at Captain Mower's tavern in Worcester (the site now occupied

by Walker's building) from the 12th to the 20th instant, for the purpose of selling patent right, and claims that the invention "has been proved to answer every purpose for beauty, ease and convenience, and vastly more durable, at a saving of about half the work, and remedies all the evils attending iron nails and wooden pegs."

In April, 1815, the Worcester Tannery is offered for sale. It is described as situated in the centre of the town, and is one of the most extensive and convenient establishments in the State, in perfect repair, and with all the accommodations and necessary tools for carrying on the business.

"Through the middle of the yard runs a large brook, confined by a very handsome stone wall. A few rods from the tan-yard is a building in which bark is ground by water, and in which there is a patent bark-mill, strong and well-constructed."

This is the tannery formerly referred to as owned by Samuel Johnson, and was located east of the present site of Exchange Hotel.

Some reason for the sale of the tannery may be found in the heavy taxes upon leather. The other tanneries in different parts of the county appear to have suffered, for no less than nine are offered for sale during 1816 and 1817.

The discontent of the workers and makers of leather, and others, finds expression in the following notice, which appeared May 31, 1815:

Shoemakers ahoy! Have you been at the Collector's and given bonds, with two sufficient sureties, to pay duty upon your work?

If you make a single boot or shoe above \$5 value without giving bonds to secure the duty to Government, you do it at your peril, and are subject to a penalty of not less than \$500!

What is your situation better than that of Virginia negroes? You must account for every pair of boots you make to the Collector. You must tell how much you ask for them, whom you make them for, and how many pair you make; and, to crown the whole, all this must be done under oath. No, that does not crown the whole; one thing more, whenever a customer breaks, or runs away, or cheats you, in addition to the loss of the article itself, and the labor, you must pay the duty upon it to the Government! This is the crowning, the cap-sheaf.

Silversmiths, carpenters, jobbers, hatters, tailors, tobacconists, boat-builders, tin-men, blacksmiths, and ye mechanics and manufacturers of all articles and commodities of whatever name and nature, be ye also ready. A fine of \$500 awaits you unless you comply with the provisions of these arbitrary, iniquitous laws passed by Congress the 16th and 27th February, 1815.

In May, 1815, Earle & Williams give notice that in addition to machinery for carding wool, they will have in operation, about the 1st of July, machinery for the spinning of wool, which can be spun at a rate greatly below the price of hand-spun. They also give notice, June 21st, that, in connection with Asa Mann, they have in operation, near Stone's tavern, south part of Leicester, machinery for carding wool.

Joshua Hale, at the same time, states that he has put his machines for carding wool and spinning cotton in most excellent order, and attends them himself; also that he has for sale cotton yarn made of cotton selected by himself in Savannah, which he warrants to be the best.

<sup>1</sup> Richard Hildreth's "History of the United States," Vol. III., p. 210.

In September, 1815, Thomas & William Stowell advertise that they have improved the building lately occupied for a wire-factory, one and a half miles south of the meeting-house, where they have put their works in the best order for dressing cloth, and are in readiness to meet any demands in their business.

It may be interesting to note, in passing, that at this time the postage to Boston, on single letters, was fifteen cents.

John W. Lincoln, in January, 1816, advertises all sizes of nail-plates from the Millbury Rolling-Mill Company. This company was established in the latter part of December, 1815, for the purpose of manufacturing nail-plates and rods.

William Hovey, June, 1816, advertises a double carding-machine in operation for custom work at his factory, one mile south of the meeting-house in Worcester, where merino wool is carded in the best manner.

October 2d he gives notice that he has taken George March into company with him, and that at Hovey's mill they will manufacture wool into cloth; price for spinning wool, three cents per skein.

At this time considerable interest was manifested throughout the country in manufactures, and frequent meetings were held for the purpose of devising means for their encouragement. A committee of the Legislature in New York urged that members of Congress be instructed to attempt to have the duties on woolen and cotton increased; urged the public officers to clothe themselves in American cloth, and that manufactures be exempt from taxation, and manufacturers from serving in the militia, and from other public duties.

It appears to have been quite popular at this time for American statesmen to appear in clothes of American manufacture. It is said that Henry Clay, when once in Millbury, was presented with a roll of blue broadcloth, the product of the mill of Colonel Sheppard, and Mr. Clay remarked that his next suit of clothes would show Congress what American manufacturers could do.

Daniel Webster also had a suit of clothes made for his use in Washington from cloth made by the Goodell Manufacturing Company, at Millbury, woven, very likely, upon looms made by W. H. Howard, of Worcester.

The following notice appears in the *Spy* of October 22, 1817:—

The Members of the Worcester Honorable Society, being prisoners for debt on parole, and deprived of the means of supporting themselves in prison, or their families at home, or of paying their debts, and unwilling their time and talents should be lost to themselves or to the public, hereby give information to their creditors and the good people of this vicinity that there are in the society those who can perform the business of farming, shoemaking, masons, clock and watch repairing, card making, mathematical and meteorological instrument making, painting and glazing, engraving, distilling, rope making, etc., and solicit a share of their patronage in the above-named kinds of business, which they can perform within the limits; and they engage they will promptly and faithfully attend to all business entrusted to them.

Worcester Gaol, Oct. 22, 1817.

This is interesting, as indicating the variety of small manufactures carried on in and about Worcester at this time, and as illustrating the unfortunate working of the law then in force, which deprived many worthy men of any opportunity of escaping from their misfortunes.

In October, 1819, the Worcester Agricultural Society gave its first exhibition. Among the Worcester exhibits of domestic manufactures were two pieces of kerseymere and one calf-skin, tanned and curried in two days by Reuben Wheeler.

Nine skeins of tow yarn, from thirty-three to thirty-eight skeins to the pound, spun on a great wheel by a lady in Worcester.

The judges noted with regret that no hoes, scythes, plows, wool, cotton and machine-cards were exhibited in a county which had long been distinguished for the manufacture of these articles, and, in their opinion, no cotton cloth sufficiently good was offered to be entitled to a premium.

## CHAPTER CXCII.

### WORCESTER—(Continued.)

#### MANUFACTURING AND MECHANICAL INDUSTRIES.

*Streams and Mill Privileges—Population of Worcester—Blackstone Canal—The Railroads—The First Expresses—The Old Coal Mine—Peat-Stage Lines.*

THE introduction of steam-power, the opening of the Blackstone Canal and the railroads, have made it possible for a large manufacturing city to grow where otherwise no considerable progress could have been made; for had it been necessary to depend altogether upon water-power, few large factories could have been located upon the small streams which constitute the head-waters of the Blackstone.

These streams, nevertheless, have played a most important part, affording means for starting manufactories which have since so largely developed in size and variety; while the increased demand for power has been met by the introduction of steam-engines, through whose medium the waters which formerly were directly applied to the water-wheels, and whose capacity was consequently limited, are now equal to any demands which may be made upon them. For these reasons the water privileges and streams deserve prominent mention in any account of the manufacturing industries of Worcester.

The Ramshorn stream, so called, rises in Ramshorn Pond, which lies two-thirds in Millbury and one-third in Sutton; it flows in a northerly direction and is joined by Kettle Brook in the northeasterly part of Auburn.

Kettle Brook rises in Paxton, is fed by Lynde and Parsons Brooks, flows in a southerly direction and joins the Ramshorn stream, as above stated; the united streams, known as French River, flow in a

northeasterly direction. At New Worcester, Tatnuck and Beaver or Turkey Brooks unite with French River, and the course becomes a little south of east. At this point the stream is known as Middle River for about a mile; Mill Brook then joins it, and from this point the river is known as the Blackstone.

Ramshorn Pond is owned by the manufacturers on the Blackstone River, who are assessed for all expenses and repairs. The pond and stream have a water-shed of nine thousand two hundred and fifty-five acres. There are five privileges on this stream, previous to its entering the town of Auburn, the third privilege being that occupied by the old shop of Thomas Blanchard, where the eccentric lathe was invented by him, and is of considerable historic interest. The sixth privilege, which is in Auburn, is known as Larned's village or Pondville. There was a saw-mill here as early as 1794; later a mill was built for the manufacture of woolen goods, which has since been used for worsteds. Pond & Larned formerly owned this privilege, which is now occupied by Kirk, Hutchins & Stoddard.

The seventh privilege has long been known as Dunn's Mills; here saw, grist and shingle-mills have been located at different times; plow handles, probably for Ruggles, Nourse & Mason, were at one time made here. The old mills were burned some time ago, and the privilege is now used for a shoddy-mill.

A mile beyond, Kettle Brook and Ramshorn stream unite, not far from the French meadows, on the left of the Norwich and Worcester Railroad coming from Auburn to Worcester.

Kettle Brook flows from a reservoir in Paxton, which was built and is owned by the mill-owners along the stream.

The first privilege is an old saw-mill, but little used and somewhat dilapidated, owned by the town of Leicester. The second privilege down the stream is what was known formerly as Mulberry Grove (now Mannville), and is at present utilized for the manufacture of satinets by the Mann Brothers.

The third privilege is what is known as Kent's, built by the father of Mr. P. G. Kent, of Jamesville, who first built a saw-mill, then changed it to a shoddy-mill, then into a satinet-mill, which is now run by P. G. Kent & Brother.

The fourth privilege is Bottomly's brick mill, built by him, and known as his third mill. It is now owned and occupied by E. D. Thayer, and utilized for the manufacture of satinets.

The fifth privilege is the Chapel Mill, built by Mr. Dickinson, now used for satinets.

The sixth privilege is called the Eli Collier Mill. This was also built by Mr. Dickinson, and is run on satinets.

The seventh privilege was the Watson Mill, used for the manufacture of broadcloth. It was burned some time ago, and has never been rebuilt.

The eighth privilege is the old mill built by Thomas Bottomly, an Englishman. This was one of the first mills built in this region, and is said to have been built before any of the mills on the stream. Mr. Bottomly was one of the pioneers in the broadcloth business, which he conducted at this mill for many years. It has been remodeled, and is now owned and run by George W. Olney. Mr. Hodges was Mr. Olney's predecessor.

The ninth privilege is one on which a mill was built by Thomas Bottomly for the manufacture of broadcloth, and was known as his "second mill."

Lynde Brook empties into Bottomly's Pond, and a short distance up this stream is the Worcester Reservoir. This mill has passed through several hands, and is now owned and occupied by Albert E. Smith, who makes woolen goods.

The tenth privilege was occupied by Robert Young for a saw-mill, which was afterwards changed into a satinet-mill and was washed away in the Lynde Brook disaster; it was then merged in the Ashworth & Jones privilege.

The eleventh privilege was formerly occupied by a grist-mill, built by a Mr. Adams, who sold it to Wadsworth & Fowler. The grist-mill was torn down and replaced by a satinet-mill, which, after some time, was sold to Ashworth & Jones, who erected there a handsome mill, one hundred and seventy by fifty feet, four stories high, which was run on beaver cloth. In 1886 it was purchased by Mr. E. D. Thayer, Jr., who carries on a large business in the manufacture of woolen goods.

The twelfth privilege was originally occupied by a shingle-mill, then by a paper-mill, which was changed into a satinet-mill; it then passed into the possession of Ashworth & Jones, who connected it with the privilege next above.

The thirteenth privilege is known as Darling's, and was first occupied by Solomon Parsons. It then passed into the hands of Mr. Darling. Satinets have always been made here.

The fourteenth mill is known as Hunt's. This was also built by Solomon Parsons, and sold to Bel-lows & Darling. Cotton batting was first made here, and then satinets. It is now run by a Mr. Butler in the manufacture of satinets.

The fifteenth is the Jamesville privilege, which Benjamin James bought of the heirs of the Burnett estate. It was originally a saw-mill in the woods. Mr. James bought soon after 1850 and built the factory, which he ran on hosiery till about 1860; he then changed to army cloth, and after that to fancy cassimeres. It was run up to the time of Lynde Brook disaster, when the dam was destroyed, the water plowing twenty feet beneath the dam. The mill was rebuilt and ran on cassimeres till about 1880. It passed through several hands, and finally came into the possession of P. G. Kent & Co., who enlarged the mill and now make satinets. There is

quite a village at this point, a chapel and depot. One hundred and ten hands are employed in the mill.

The sixteenth privilege is occupied by the Stoneville Mill.

The waters of Kettle Brook come into the Stoneville Pond at the end nearest New Worcester; at the other end a stream comes in which has been known as Young's Brook, and by other names. About a mile up this stream was an old paper-mill, erected about 1834 by Nathaniel S. Clark and Daniel Heywood. Kettle Brook with this stream carries the Stoneville Mill, now operated by the Stoneville Worsted Company in the manufacture of yarn for the carpet-mill of William J. Hogg.

In 1834 Jeremy Stone owned this mill; it then went into the possession of Edward Denny, next of A. L. Ackley, and later was changed from woolen to cotton goods.

John Smith bought the mill about 1858, and it was subsequently run by his sons—C. W. & J. E. Smith—for many years. About a mile from this point Mill Brook joins the Ramshorn stream, and thence proceeds through the French Meadows, and is known as the French River.

At the next privilege Mr. Trowbridge, grandfather of William T. Merrifield, built, in 1810, a mill for the manufacture of cotton yarns. There had previously been a saw-mill, and possibly a grist-mill at this point. At this time Joshua Hale was carding wool at the privilege now occupied by Albert Curtis, and the farmers were in the habit of taking their wool to Mr. Hale to have it carded and spun, and bought their yarn at Trowbridgeville, doing the weaving at their own homes.

Tatnuck Brook has a water-shed of eight thousand nine hundred and forty-three acres. Upon an old map, published in 1784, a trip hammer-mill, a corn-mill and a saw-mill are found upon Tatnuck Brook, within the limits of the town of Worcester. The first mill recollected by those now living is a saw-mill in Holden, owned by a man named Hall; this was prior to 1850. The second privilege was near the outlet of the present reservoir, where there was another saw-mill.

The third privilege was at Tatnuck. The fourth privilege was the old mill built in 1834 for David T. Brigham, in Tatnuck, near the bridge on the road to New Worcester; it is now used for making satinetts. It was built by William T. Merrifield in 1834. The fifth privilege was Patch's saw and grist-mills.

The sixth privilege was a small mill, and the seventh, the upper privilege now occupied by the Coes Manufacturing Company. This and the lower privilege on Leicester Street are more particularly described in that part of this article which treats of the wrench business.

Tatnuck Brook was known at one time as Half-

Way River, as the bridge at New Worcester was halfway from Boston to Springfield. On its tributary, Turkey or Beaver Brook, a saw-mill was located in 1784.

At the junction of Tatnuck Brook and Ramshorn Brook was the old original dam which was removed by Mr. Albert Curtis about 1845.

The privilege now occupied by factories of Albert Curtis and Curtis & Marble is described elsewhere.

Next to this privilege is the one occupied by the Hopeville Manufacturing Company, manufacturers of satinets. This was occupied by Thomas Sutton in 1831, where he put in the first iron water-wheel in the county. Sutton's original mill was burned in 1862. About 1848 there was a cotton-mill here run by S. H. Thayer. This was formerly known as Hornville, so called because, when the first mill was built, there was no bell, and the help were called to work with a horn.

The first mill located here was a grist-mill. Bigelow & Barber bought the privilege in 1853.

Next come the carpet-mills, once the location of White & Boyden's machine-shop, where Mr. Albert Curtis learned his trade. Hatch & Gunn here commenced the manufacture of broadcloth in 1827; they were the first in Worcester to make woolen goods throughout. Then comes the Wicks Manufacturing Company, who recently commenced the manufacture of worsted suitings.

The next privilege is the one now occupied by the Worcester Wire Company, which has been used as a manufacturing site for many years and for many different purposes.

Upon the map previously referred to published in 1784, North Pond is said to cover thirty acres of ground. John Pierce's map, 1795, gives the area of North Pond forty acres, and says that in that year there were in Worcester five grist-mills, six saw-mills, one paper-mill. Near where Mill Brook leaves North Pond there were situated, in 1784, two fulling-mills; just southeast of the court-house was a trip-hammer shop. Between the two and just north of Lincoln Square the old mill of Captain Wing was located in 1685. Then a grist-mill, probably on the site of the Crompton Loom-Works, and a saw-mill was located at Quinsigamond, with the statement that "there is soon to be a paper-mill."

Mill Brook has a water-shed of seventy-seven hundred and fifty acres. The first privilege below North Pond Dam was occupied by a cotton-mill built by George T. Rice and Horace Chenery, about 1830.

The second was a factory built by Frederick W. Paine for Washburn & Goddard, and occupied by them until 1834; then by Goddard & Parkhurst until 1838, when it was leased for a short time by Ichabod Washburn, and was later occupied by William Crompton until it was burned in February, 1844.

The third privilege was the old tannery privilege, originally built by Dr. William Paine, father of F. W.

Paine, for a grist-mill, which was run by the family for many years.

About 1836 N. Eaton & Co. had a paper-mill here. The Olivers, stove dealers, next used the privilege to grind black lead. In the fall of 1854 Mr. Samuel Warren purchased the property of Mrs. Oliver, and ran it as a tannery until 1885. Mr. Warren's ancestors on both sides for three generations were tanners. His main business was to supply the cardmakers with their leather. This water privilege has recently been purchased by Stephen Salisbury.

The fourth privilege is Grove Mill, where the late Mr. Stephen Salisbury built a wire-mill for Ichabod Washburn in 1834.

The fifth, Court Mills privilege. Abraham Lincoln had a trip-hammer shop here in 1795; Earle & Williams a machine shop in 1812, and a bark-mill was probably run in connection with the old tannery located just back of Exchange Hotel in 1815.

Before Court Mill was burned there was an old one-story building located here, used in 1828 by William Hovey for the manufacture of shears and straw-cutters. The basement of the new Court Mills was built of the stones which came from the old jail, which stood on the square facing the present depot.

Howard & Dinsmore took the first lease of the Court Mills, and were succeeded by Mr. Samuel Davis.

The sixth privilege was built by F. W. Paine, at the corner of School and Union Streets. It was occupied at first by a small wooden building, thirty by eighteen, two stories high; the basement was occupied by W. H. Howard, lead pipe manufacturer; the second story by Calvin Darby, who ran a carding-machine. Mr. Howard was bought out by Ichabod Washburn in 1822, and January 1, 1823, Mr. Washburn and Benjamin Goddard formed a partnership, and at the same time bought out Calvin Darby. They manufactured woolen machinery here until their removal to Northville, in 1831. March, Hobart & Co. succeeded them. The premises have been occupied by various parties from 1822 till the present time in the manufacture of woolen machinery, N. A. Lombard & Co. being the present owners.

The seventh privilege was called Flagg Mills, afterwards known as the Red Mills, and owned by William B. Fox.

The Red Mills were occupied by sash and blind and cutlery manufacturers, while from the same privilege was obtained power which ran the woolen-mill of Fox & Rice, on the other side of the street. This privilege was sold, and the site became part of the sewerage system in the mayoralty of James B. Blake.

The eighth privilege was occupied by the upper and lower paper-mills at Quinsigamond, later and at present by the works of Washburn & Moen Manufacturing Company.

The ninth and last privilege in Worcester was occupied by the Perry Grist-Mills, which were built in 1831.

Mill Brook has played an important part in the development of the manufacturing interests of Worcester, and three distinct privileges on this stream have been occupied by wire factories, while the first experiments of Ichabod Washburn were conducted at the present location of the Lombard Factory, on School Street. The first wire-mill was located at Northville, and later was moved down the stream to the Grove Mill privilege, and later still the Quinsigamond privilege was used for this business. Mill Brook is now condemned to the main sewer shortly after it leaves the works of Washburn & Moen Manufacturing Company, in Grove Street, from which it emerges into the Blackstone, just below the works at Quinsigamond.

It was not until 1820 that Worcester took first rank among the towns of the county. The census of 1765-76 gave Worcester the fifth place in population, following Sutton, Lancaster, Mendon and Brookfield. In 1790, 1800 and 1810 Worcester stood third in order, Brookfield and Sutton preceding.

In 1820 Worcester took first place, and from that time to the present has shown a constantly-increasing percentage of the population in the county. That percentage amounted to something over eleven per cent. for the decade ending 1830, and over fifty per cent. for the decade ending 1880; while of the increase (17,142) in the population of the county between 1880 and 1885, 10,098, or nearly fifty-nine per cent., belongs to the city of Worcester; and of the population of the county, which was 244,039 in 1885, Worcester had 68,389, or a little over twenty-eight per cent. In 1820 the population of Worcester was 2,962, and of the county 73,625.

This brings us to the time of the building of the Blackstone Canal between Worcester and Providence, which marks an important epoch in the progress of Worcester, and too much credit cannot be given its projectors for appreciating the necessity to Worcester of communication with the seaboard. It is true that the canal was never of great practical value, by reason of the better facilities for business afforded by the railroads. It is equally true that without the railroads the canal would have ensured the growth and prosperity of the town.

The plan of making a navigable water-way from Providence to Worcester was first suggested, in 1796, by Mr. John Brown, of Providence, and his associates, but the Legislature of Massachusetts, failing to assent to an act of incorporation, it was not then carried into execution.

In May, 1822, "Gentlemen who are friendly to the project of a canal from Worcester to Providence are requested to meet at Colonel Sikes' Coffee-house on Friday evening, at seven o'clock." Another meeting was held on May 24th, and a committee appointed,

upon which the following gentlemen served: Levi Lincoln, John Davis, John W. Lincoln, William E. Green, John Milton Earle, Edward D. Bangs.

In September, 1822, the surveys of the canal were completed. According to the report of the committee, the length of the canal would be forty-five miles and the descent from Thomas Street to tide-water in Providence 451½ feet.

The ground was bored every twelve rods for the whole distance, and upon the route selected no rock was found within the depth of excavation. The engineer reported, "I have come to the conclusion that a canal 32 feet wide at the top, 18 feet at the bottom and 3½ feet depth of water, would be a proper size to be formed, and that locks of 70 feet between the gates and 10 feet in width would be sufficiently large for the trade intended."

The estimated expense of the work, including locks, was \$323,319.

The excavation in Rhode Island was commenced in 1824, and a meeting of the Blackstone Canal Company was called at the Thomas Coffee-House, Worcester, April 9, 1825, for the purpose of forming a corporation.

Great expectations were formed of the amount of business that would be done, and it was claimed that the canal would more than double the value of real estate within six miles of it. The subscription books for \$400,000 of the capital stock, were opened in Providence, April 27th; three times the required amount was subscribed for, and the stock sold at a premium.

In May, 1826, the canal was located in the village of Worcester.

Fears were entertained in Boston at this time that the canal would divert trade from Boston to Providence; to counteract this, a plan for a railway between Worcester and Boston was proposed. It is related that a wag, happening to be in town when the account of the sale of canal stock was received, was asked what the Boston folks would do when they heard of that. "Oh," replied he, "they will rail a-way!"

The first canal-boat to arrive in Worcester was the "Lady Carrington," which arrived from Providence October 7, 1828, and moored in the basin in Central Street, at head of canal at eleven o'clock, and was advertised "To take passengers for Millbury to-morrow morning, returning in the evening, and she will remain here during the present week for the accommodation of parties."

The arrival of the "Lady Carrington," according to an account in the *National Ægis*, October 8, 1828, "was greeted on passing the locks by the cheers of the multitudes assembled. On reaching the Front and Central Streets bridges continued cheers hailed its approach. At eleven o'clock the boat arrived in the basin, and the commissioners and the crowd assembled were addressed by Colonel Merrick, chairman

of the Board of Selectmen, who expressed the sentiments appropriate to the occasion. On the conclusion of his remarks, enthusiastic cheers, the thunders of cannon and the peal of bells welcomed the visitant to the town. The commissioners and other gentlemen of both States were passengers on the boat, and with the gentlemen of the town partook of a collation at the house of the Governor."

The following notice appears in the *Spy* at this time:

Port of Worcester, October 8, 1828. Arrived yesterday, Canal-boat "Lady Carrington," Captain Dobson, from Providence, with slate and grain for Nathan Heard.

At the end of October "Lady Carrington" arrived in Providence loaded with domestic goods—butter, cheese, coal and paper.

The following extracts, taken from the papers of the day, will give some notion of the amount and character of the goods shipped:

Canal-boat "Providence," Captain Dobson, with 10,000 lbs. lead pipe from T. & J. Sutton, machinery from William Hovey, and iron castings from Sumner Smith.

Departed, boat "Massachusetts" for Providence, with 26 casks of beer and 11 hogsheds from Trumbull & Ward.

Arrived, canal-boat "Worcester," Captain Green, from Providence, with 3457 lbs. of iron for Washburn & Goddard, 4169 lbs. of lead to J. & T. Sutton, 13 bales of cotton, 3 tons of logwood and one ton of copperas for William Buffum, Jr.

But there were three serious drawbacks to the prosperity and profits of the canal, which soon made it unpopular with most of its stockholders and patrons. Unfortunately, a portion of the canal was located in the Blackstone River, and boats were more or less delayed in high, and also in low water, and in some seasons for weeks were detained with goods which were wanted for immediate use or sale. In some years the canal was for four or five months closed with ice. In a season of drought the manufacturers were jealous of the boatmen drawing so much water, and on several occasions in Rhode Island the owners of the mills and of the water-power ordered large loads of stone tipped into the canal-locks to prevent the boats from passing, which almost excited a riot among the boatmen, and some of the mill-owners were afraid their mills would be fired, as they had been threatened.<sup>1</sup>

April 22, 1846, the *Spy* states that the canal company had sold all that portion of the canal in Massachusetts, with all the privileges and franchises, except the reservoirs, for the sum of twenty-two thousand five hundred dollars to the Providence and Worcester Railroad Company, and April 25, 1849, the locks, boats and water-rights were advertised for sale. The last toll was collected November 9, 1848, but meantime more efficient means of communication between the sea-board and Worcester was afforded by the railroads.

In March, 1831, subscription books were to be found at the banks, where those who wished could

<sup>1</sup> "History of the Blackstone Canal," by Colonel I. Plummer.

subscribe to the stock for a railroad from Boston to Worcester.

The Boston and Worcester Railroad Company was chartered June 23, 1831, to build a line from Boston to Worcester,—a distance of forty-four miles. A train was run through to Worcester July 4th; but it was not until July 6, 1835, that the road was formally opened, although the cars had, for some time previous, been running from Boston to Westboro', and, as early as April 16, 1834, to Newton. The train of July 6th to Worcester consisted of twelve cars drawn by two locomotives, and contained the president, directors, stockholders and invited guests to the number of about three hundred.

The train, which left Boston at a quarter before ten, arrived in Worcester at about one o'clock. It was met by a committee, of which Charles Allen was chairman; a procession was formed under the direction of General Nathan Heard, and proceeded to the Town Hall, where a collation was served and speeches made. At four o'clock the train started on the return trip to Boston.

At the Insane Asylum, when the first locomotive passed, one of the inmates remarked: "Well, that beats the very devil; I never before saw a critter go so fast with such short legs!"

In April, 1836, the business of the Boston and Worcester Railroad Company was said to have been more than double the amount of that of the corresponding time of the year preceding; passenger cars were well patronized, and there was more freight than the company was prepared to care for. During the first five months of 1837 the receipts were twenty-six thousand dollars more than during the same period in 1836, and continued to show a steady increase.

The Western Railroad Company was chartered February 15, 1833, to construct a line from the terminus of the Boston and Worcester Railroad to Springfield, and thence to the western boundary of the State. A mass-meeting was held in Faneuil Hall, Boston, October 7, 1835, to take measures to ensure the subscription to the capital stock of \$2,000,000. This was accomplished, and the following winter the Legislature authorized a subscription of \$1,000,000 in behalf of the State, making the capital stock \$3,000,000. At this meeting Edward Everett made a speech, in which he insisted upon the importance to Massachusetts of "Communication with the West."

Trains commenced their regular trips between Springfield and Worcester October 1, 1839. The time occupied in making the journey was about three hours. A public dinner was given in Springfield in honor of the opening of the road, October 3, 1839, on which occasion Edward Everett said:

Let us contemplate the entire railroad, with its cars and engines, as one vast machine. What a portent of art! Its fixed portion one hun-

dred miles long; its movable portion flying across the State like a weaver's shuttle. By the seaside in the morning, here at noon; and back in the compass of an autumnal day. And the power which puts all in motion, most wondrous, a few buckets of water! . . . Did we live in a poetic age, we have now reached the region where the genius of steam communication would be personified and embodied. Here we should be taught to behold him a titanic colossus of iron and of brass, instinct with elemental life and power, with a glowing furnace for his lungs and streams of fire and smoke for the breath of his nostrils! With one hand he collects the furs of the arctic circle, with the other he smites the forests of Western Pennsylvania. He plants his right foot before the source of the Missouri and his left on the shores of the Gulf of Mexico, and gathers in his bosom the overflowing abundance of the fairest and richest valley on which the circling sun looks down.

September 14, 1867, the two Massachusetts corporations were consolidated under the name of the Boston and Albany Railroad Company, and on December 28, 1870, a further consolidation was effected with the New York roads, thus forming the present organization.

The Norwich and Worcester Railroad Company was chartered in March, 1833. The first meeting of the company was held at Webster July 1, 1835. The length of the routes surveyed was a little short of sixty miles, and passed through thriving villages, while upon the banks of the adjacent streams there was said to be water-power sufficient to carry one million spindles; the number of cotton-mills was seventy-five and of woolen-mills twenty-seven, exclusive of Worcester and New London. There were said to be one hundred and forty manufacturing establishments between Norwich and Worcester, within five miles of the road. Though fifteen miles longer than the Boston and Worcester Railroad, it was estimated it would cost five hundred thousand dollars less. Regular trips between Worcester and New London commenced March 9, 1840, and the fare to New York by this route was fixed at five dollars.

R. W. Whiting, Nov. 21, 1838, advertises that, having made arrangements with the Boston and Worcester Railroad Co. to occupy a part of a car, to be run with the passenger train to Boston in the morning and back in the afternoon, commencing on Monday, 26th of November, he will take charge of all packages, bundles, etc., which may be entrusted to his care, and will see them safely delivered the same day, and that he will also transact with promptness any other business committed to his care.

He had an order-box at the Temperance Exchange, Railroad Depot and the American Temperance House, where he could be found after seven in the evening and before seven in the morning.

William F. Harnden has always been credited with being the father of the American Express system. His advertisement is found in the *Spy* of June 24, 1840, where he announces that the Worcester, New York, Philadelphia, Baltimore and Boston Baggage Express will commence July 1, 1840, running daily, and that he will forward in his express car daily, packages, bundles, etc., to and from each of the above-named places,—to Boston by steamboat-train

every morning, and to New York every afternoon at half-past four.

All packages must be marked Harnden's Express, and sent to his office, N. Tead's Hat Store, one door north of the Post-Office, Worcester. Simeon Thompson, agent, Worcester.

WM. F. HARDEN, *Prop.*,  
8 Court Street, Boston.

S. S. Leonard, in the *Spy* of August 12, 1840, advertises an express between Boston and Worcester.

September 2, 1840, Burke & Co. advertise the New York and Boston Baggage Express, *via* Norwich and Worcester, run by the subscribers, P. B. Burke & Alvin Adams. Packages to be left at J. B. Tyler's, Worcester.

The question of a railroad between Providence and Worcester, a distance of forty-three miles, was seriously discussed as early as 1837, but nothing was done for several years. In August, 1845, the enterprise came nearly to a stand-still, although eight hundred thousand dollars had been subscribed under the Rhode Island charter and one hundred thousand dollars under the Massachusetts charter; but the Rhode Island charter required that the whole capital of one million dollars should be taken up before the company could proceed. The amount was finally raised, and a consolidation was effected November 4, 1845, of the Massachusetts and Rhode Island Companies, each of which was chartered in 1844. The main line was opened in October, 1847, when a train, made up of nine covered cars and twelve or thirteen open cars, drawn by three powerful engines, arrived in Worcester with twelve hundred passengers from Providence and towns on the line.

The Worcester and Nashua Railroad Company, organized in November, 1846, was a consolidation of a company of the same name, chartered in Massachusetts March 5, 1845, and the Groton and Nashua Railroad Company, chartered in New Hampshire December 4, 1844. The road was opened from Worcester to Nashua, a distance of forty-six miles, December 18, 1848. The Nashua and Rochester Railroad Company was chartered July 5, 1867, and opened from Rochester to Nashua, a distance of forty-eight miles, November 24, 1874. William A. Wheeler was one of the principal promoters of the Nashua Railroad, and was the superintendent of construction.

December 1, 1883, the Worcester & Nashua and Rochester Railroads were consolidated under the name of the Worcester, Nashua & Rochester Railroad Company, which company was leased to the Boston & Maine Railroad Company October 30, 1885, for fifty years from January 1, 1886.

The Boston, Barre & Gardner Railroad Company, running from Worcester to Winchendon, a distance of thirty-six miles, was chartered April 24, 1847, as the Barre & Worcester Railroad Company, and April 24, 1857, as the Boston, Barre & Gardner Railroad Company. It was opened to Gardner, September 4,

1871, and to Winchendon, January 4, 1874. It was taken possession of by the Fitchburg Railroad Company March 7, 1885, and merged in the latter company as a branch, July 1, 1885.

It will thus be seen that from an early day Worcester had the advantages of the best railroad facilities, and to this, and to the introduction of steam-power, is to be most largely attributed her rapid growth as a manufacturing city. At the present time there is not only direct communication with all points north and south, but there are five outlets and thirteen different lines, more or less, affording direct communication with the West. Edward Everett's wish, so strongly expressed in his speech in Faneuil Hall prior to the opening of the Western Railroad, is most perfectly fulfilled.

In 1823 attention is called to the advantages possessed by Worcester which should make it a large manufacturing centre. Encouragement is found in the fact that towns in the interior of England, with no greater local advantages, have contained from 10,000 to 15,000 inhabitants, and since the introduction of steam-power, a population of from 80,000 to 100,000 has been reached. It was stated that Worcester would soon be at the head of canal navigation, and in addition, her "inexhaustible store of anthracite coal, well calculated for steam-engines," was referred to as being of the greatest value.

Considerable attention was given in 1823 to the examination of the anthracite coal deposits, which were located northeast of the city, west of Plantation Street, and near its junction with Lincoln Street, now known as the Old Coal Mine.

The coal was said to be of the same variety as the Rhode Island, Schuylkill and Lehigh coal, and was found, according to statements then made, to ignite easier than any of them and to burn longer. Careful comparisons were made of the relative value of these different varieties and the result, with a given quantity of each, showed as follows:

Worcester coal lasted five hours; Lehigh, four hours twenty-five minutes; Rhode Island, three hours thirty-six minutes. The thermometer was raised by the Worcester coal to one hundred and seventy-nine degrees; by the Lehigh, to one hundred and sixty by the Rhode Island, to one hundred and thirty-four.

The Worcester coal burned brighter than the others, and with more flame. It was confidently asserted that when the Blackstone Canal should be completed Worcester coal would be the cheapest fuel for Providence; it was estimated, however, that the Worcester coal was more impure than the Lehigh, containing a considerable portion of earthy matter that remained in the form of ashes after burning; but, in spite of this, it was thought that it would answer a valuable purpose. Tests were made at the Worcester Brewery which appear to have been satisfactory, for in February, 1824, application was made to the General Court for the incorporation of the Massachusetts

Coal Company, to ascertain the quality and quantity of the coal, and expense of mining and conveying it to market.

For the next two years it appears to have been used as the principal fuel in the brewery of Trumbull & Ward, and was also used in Colonel Gardner Burbank's paper-mill. It was found there, that about half of the bulk of the coal remained after the fire subsided, but upon replenishing with new coal it was mostly consumed in the second burning, and Colonel Burbank found the expense of keeping a fire with this coal to be less than the expense of cutting wood and tending fire, if the wood were delivered at the door free of expense.

In December, 1827, the proprietors of the brewery burned coal taken from the land of William E. Green, which was a little distance from the mine, but appeared to be of a somewhat better quality.

Work at the coal mine must have been prosecuted with some vigor, for in February, 1828, fifteen or twenty young men and a blacksmith were wanted to work there.

In November, 1828, an opening twelve feet wide and eight feet high had been carried into the hill about sixty feet, at a descent of about twenty-five degrees, and a railway was laid, on which the coal was carried from the mine to the place of deposit, in loads of fifteen hundred pounds.

In February, 1829, the Worcester Coal Company was incorporated, and in March, 1829, the Worcester Railway Company, with a capital of fifty thousand dollars, with authority to build a railway from the mine to Lake Quinsigamond and to the Blackstone Canal, but the enterprise appears to have been abandoned shortly afterwards. The coal was found to be too impure for economical use. It was somewhat humorously said that there was a d— sight more coal after burning than there was before.

Peat was also found in the meadows about Worcester. In 1856 it was introduced into the Wire Factory as a substitute for wood and coal; in three years nearly two thousand cords were used in this way, and it was found that a cord of well-seasoned peat would produce as much heat as a cord of dry oak wood; and a cord and a half of peat would generate as much steam as a ton of anthracite coal.

It was estimated that peat could be used to good advantage for manufacturing purposes at a saving of from thirty-three and one-third to fifty per cent. over any other kind of fuel. It had the remarkable quality of keeping fire a long time, even burning for a week after the fire had gone down. In April, 1856, the Worcester Peat Company was formed, but no business of consequence appears to have been done by it. It was no doubt found that coal was the cheaper fuel.

In June, 1827, Worcester is spoken of as containing "the large paper-mills belonging to Elijah Burbank, five machine shops, at which great quantities of machinery of various kinds are made, one small

Cotton factory, a Lead aqueduct factory and other works of minor note."

Prior to 1813 there was no stage or mail route between Worcester and Providence; in that year, or 1814, it was attempted to run a stage, but the business was only sufficient to support a cheap carriage and two or three horses, and the proprietors abandoned it.

Until 1819 the mail was carried once a week in a one-horse wagon; an attempt was then made to run a two-horse stage twice each week, but this did not pay, and was abandoned,

In 1823 a line of stages was started and well patronized.

For a long time the only stages from Worcester were six times each week to Boston, and six times each week to New York.

In 1827 there were eighteen different lines of stages running from Worcester, and the passengers averaged one hundred daily.

## CHAPTER CXCIH.

### WORCESTER—(Continued.)

#### MANUFACTURING AND MECHANICAL INDUSTRIES.

*Textile Fabrics and Machinery for Making Them—Early Manufacture of Cloth—Condition of Woolen Manufacture—John Goulding—Manufacture of Cotton and Woolen Machinery—Card Clothing—Looms—Cur-pits—Thread.*

WE have already noticed that Samuel Brazer in 1790 advertised to sell "corduroys, jeans, fustians, federal rib and cotton," and that at the same time he and Daniel Waldo were proprietors of the Worcester Cotton Manufactory. There was then scarcely any machinery for the manufacture of cloth in America; it had been introduced into England, but there were severe laws against its exportation to the colonies.

The process of making cloth, as early conducted, was entirely by hand-power. Hand-cards were used for straightening the fibre of the wool or cotton, which was spun by a single spindle driven by a wheel kept in motion by the hand of the operator. The yarn was woven upon hand-looms, and the cloth thus made was sent to the fulling-mill, which was the first branch of the business not conducted in the household.

Fulling-mills were scattered all over the country for the purpose of finishing the cloth made in the farm-houses.

John Earle and Erasmus Jones in 1810 "erected wool-carding machines to pick, break and card wool at the building known as Lincoln's Trip-hammer shop, fifteen rods east of the Court-house."

In 1811 William Hovey, an ingenious mechanic, advertised a new shearing-machine, called the "Ontario Machine," and warned all persons against making or using a machine embodying the principle on which this was constructed, "which covers a

spiral revolving shear working against a straight blade or cutter." One of the advantages claimed for this machine was that it could be carried anywhere in a one-horse wagon, and could be operated either by hand or water-power. It was claimed that this machine would facilitate that laborious branch of the business ten-fold.

Hovey constructed another machine in 1812, in which the shears moved across the cloth on the same principle as hand-shears, and he claimed that with this machine he could shear about two hundred yards of broadcloth a day as well as by hand.

In 1814 Jonathan Winslow engaged in the manufacture of flyers of a superior quality for spinning cotton.

Comb-plates for wool-carding machines were offered for sale in 1814 by Daniel Waldo at his store and by Earle & Williams at their shop. At the same time Merrifield & Trowbridge were engaged in making cotton and woolen machinery at the Trowbridgeville privilege.

The prices generally adopted for wool-carding at this time, in Worcester County, were seven cents per pound for common wool, with an addition of three cents when oil was found by the carders; twelve and a half cents per pound for carding half-blooded merino, with the like addition for oil; twenty-five cents per pound for carding full-blooded merino, with the like addition.

An improvement over the ordinary single spindle spinning-wheel is offered by the proprietor, located at Sikes' Tavern, who offers for sale "The Farmer's Spinner," which carries from eight to twelve spindles attached to a single spinning-wheel.

As an indication of the improvements being made in the construction of machinery, attention is called in 1822 to the fact that William Hovey is constructing cylinders for carding-machines entirely of iron, being cast in four parallel pieces.

Stephen R. Tenney is engaged in building wool-carding, matting, shearing and brushing-machines, in the building formerly occupied by Trowbridge & Merrifield as a cotton factory.

In 1822 Ichabod Washburn manufactured machinery for carding and spinning wool at his shop near Sikes' Inn.

January 1, 1823, Mr. Washburn took into partnership Benjamin Goddard (2d), and continued in the same business, to which they added that of carding wool, having purchased the machines lately owned by Mr. Calvin Darby.

In June, 1824, Brewster & Fox advertised the best carding-machines and workmen at their establishment, one mile south of Worcester Village,—the South Worcester privilege—carding, six cents; oiling and carding, seven cents.

The machine-shops, so called, at this time were almost exclusively engaged in the manufacture of cotton and woolen machinery.

William B. Fox, who seems at this time to have separated from his former partner, Mr. Brewster, dresses "Handsome wear" at his cloth-dressing factory, one mile south of Worcester, at twenty cents per yard, "common at sixteen cents."

Sarah Hale, widow of Joshua Hale, offered for sale, March 1, 1826, the factory at New Worcester, consisting of the building "occupied for many years past for the purposes of manufacturing cotton and carding custom wool;" but not finding a customer, she had the machines put in good order and resumed business.

Simmons & Wilder carded wool and dressed cloth about two miles south of Worcester Street.

September 13, 1826, William B. Fox moved his wool-carding and cloth-dressing business to the new building erected on the privilege formerly owned by Samuel Flagg, a few rods south of Worcester Village.

The woolen business at this time was in a most depressed condition, and was said to be done at a loss, even with the most prudent management. It was feared that the probable stoppage of the mills would be severely felt in the community. A meeting was held about this time in Boston, and it was decided that it would be advisable to apply to Congress for an increase of duties on imported woolens, or a reduction of the duty upon wool.

The cotton fabrics made in this country at this time were of excellent quality, and the business was in a much better condition than the woolen business.

A meeting was called in Worcester for Friday, December 1, 1826, at "Stockwell's," to consider the depressed state of the woolen manufactures. At that meeting a memorial to Congress was prepared, signed by Emory Washburn, James Woolcott and Major John Brown.

One of the most valuable contributions to the woolen machinery of the world was the endless rolling, or American card, invented in 1826, by John Goulding, a native of Massachusetts, and for many years a mechanic at Worcester. Previous to the development of this machine the rolls, or rolling issuing from the carding-machine, were limited to the breadth of the card, and the ends of the separate rolls had to be spliced together by hand process, by a machine called a "billy." Goulding dispensed with the "billy," and, by an ingenious combination of devices, obtained an endless roll, and so perfected his machinery that he could use it successfully from the moment the rolling left the dull end of the first picker until it was converted into yarn fit to be manufactured into cloth. This device has been styled the most important advance in the card-wool industry of that early period.<sup>1</sup>

Some knowledge of the equipment of a woolen-factory at this time may be had from a notice of a sale in June, 1827, at the woolen-factory then lately occupied by A. & D. Aldrich, and about one mile south

<sup>1</sup> *Boston Advertiser*, November 3, 1888.

of New Worcester, at which were to be offered for sale ten satinet-loom, one double carding-machine, one billy, one shearing-machine, one roping-machine, one press, one copper-kettle, one potash-kettle, press-plates.

In February, 1828, William Hovey stated that he is about to stop his manufacture of satinet shearing-machines, but will continue to make broad and cassimere shearing-machines with vibrating or revolving-shears, and also metallic grinding-machines for keeping the machines in order.

In March, 1830, it was proposed to erect in Worcester a patent hemp and flax-machine, and the Worcester Hemp Company offered to furnish seed to the farmers on the following conditions:

The company would furnish seed at the market price for cash, or in payment would take good notes on interest payable in hemp stem at eighteen dollars per ton, gross weight, when the crop was harvested and delivered at the machine, or would furnish the seed and sow on shares. The company offered to pay eighteen dollars per ton gross weight for good hemp stem delivered at the machine cut, or fifteen dollars without.

In March, 1831, Lewis Thayer and George Willey commenced the manufacture of loom-pickers at New Worcester. Lewis Thayer "carded wool at three and a half cents per pound and waited one year for his pay."

In August, 1831, Washburn & Goddard sold their business of manufacturing woolen machinery to March, Hobart & Company, composed of Andrew March, George Hobart, Henry Goulding and B. F. Smith. This firm was dissolved in 1832, and was succeeded by Hobart, Goulding & Company, who dissolved March 25, 1832. They manufactured pickers, carding-machines, condensers, jacks, etc., also comb-plates, and were succeeded by Goulding & Smith.

February 24, 1836, Goulding & Smith dissolved, D. T. Brigham having retired from the firm in 1834, and Henry Goulding continued the business alone. A co-partnership was formed, April, 1837, under the title of Henry Goulding & Company, consisting of Henry Goulding, John Gates, (2d), and Luke With-erby. They were burned out in August, 1838; the building, which was of brick, was valued at three thousand five hundred dollars, and was owned by Frederick W. Paine; the tools and machinery, valued at eight thousand dollars, were destroyed. This concern built at that time about sixty thousand dollars' worth annually of woolen machinery.

Nov. 15, 1844, Goulding & Davis, who had succeeded, dissolved, and Henry Goulding continued. April 1, 1851, Willard, Williams & Company, bought out Henry Goulding; the firm was composed of Fitzroy Willard, Warren Williams, N. A. Lombard, Charles A. Whittemore and H. W. Conklin; this firm was succeeded April 2, 1855, by F. Willard & Company, composed

of Fitzroy Willard, Charles Whittemore, N. A. Lombard and H. W. Conklin. This firm was succeeded April 1, 1861, by Bickford & Lombard, who were succeeded by N. A. Lombard, the present proprietor, who has been connected with the business since 1851.

From 1823 until the present time this business has been confined to the manufacture of woolen machinery of different kinds, and at present includes carding and spinning machinery, spinning jacks, pickers, dusters, willowers, etc.

The firm of Phelps & Bickford was composed of Horatio Phelps and William M. Bickford; W. M. Bickford succeeded William Stowell, August 31, 1831, and built woolen machinery, condensing, picking, napping and brushing-machines, also spinning jacks, at the Stowell shop in New Worcester; he was succeeded by Abel Kimball, who continued the business at the same place.

Horatio Phelps manufactured looms of all kinds in the shop formerly occupied by William Howard, at South Worcester, from whom Mr. Phelps had purchased the right to make his patent broad looms. Phelps & Bickford continued to manufacture here, after the formation of their copartnership, all kinds of woolen looms. In October, 1834, they removed from South Worcester to Court Mills, then a new building erected by Stephen Salisbury for the accommodation of parties desiring to lease factory room. Phelps & Bickford afterwards occupied part of the wire factory in Grove Street. Later, Mr. Bickford continued the business alone, and in 1859 he employed twenty-three hands in building looms in the west wing of the Grove Street mill. December 28, 1860, he moved to Merrifield's building, in Exchange Street, where he was prepared to build all kinds of Crompton looms and other fancy looms, broad and narrow; also walking, dressing and spooling machinery, with steam cylinders or pipes for drying; also all kinds of machinery and tools for making wire.

August 17, 1831, John Simmons & Co. announced that they had formed connection in business, and will supply at their new shop in New Worcester the following machinery: Broad and narrow shearing machines, pressing-machines, napping-machines. This copartnership was composed of John Simmons, Abel Kimball and Albert Curtis, and was dissolved February 21, 1832. Mr. Curtis in 1831 took a lease of Lewis Thayer, the then owner of a part of the water privilege which was originally owned by Joshua Hale. Here he erected a machine shop. The old Hale building was a wooden factory, two stories and a basement, and stood where the middle building of the Curtis & Marble factories now is.

Albert Curtis was born in Worcester, 1807. At the age of seventeen he was apprenticed to White & Boyden, who manufactured woolen machinery at South Worcester, near the present location of the carpet-mills. After learning his trade he worked

here for three years as a journeyman, at one dollar and twenty-five cents per day. In December, 1829, he went to Pittsburgh, but returned in January, 1831, and again entered the employment of White & Boyden. While learning his trade he became acquainted with his fellow-workmen, Kimball and Simmons, and they conceived the idea of going to New Worcester and starting for themselves. The firm of John Simmons & Co. was succeeded by Simmons & Curtis, who continued to make shearing and other machinery. In 1833 Mr. Curtis purchased Mr. Simmons' interest, and continued alone until 1834, when Mr. William Henshaw became a partner and so continued until 1839, the firm-name being Curtis & Henshaw. They had not room enough at New Worcester for their business, and for a time leased room of Ichabod Washburn, in the wire-mill in Grove Street. This copartnership was dissolved January 8, 1839.

In 1835 Capron & Parkhurst occupied the old Hale building, which was owned by Clarendon Wheelock.

About 1840 Mr. Curtis purchased of him the Ramshorn water privilege, building and satinnet machinery, consisting of two full sets. He had previously bought the Lewis Thayer water privilege, where the old dam stood on Tatnuck Brook, to run his machine-shop. Mr. Curtis leased the old building to John Metcalf and William C. Barber, who ran it until 1842, when it was burned, together with the machine-shop of Mr. Curtis, which was a wooden building with a basement. The original dam on the privilege stood one hundred feet from the bridge toward the location of the present dam, and was about sixty feet long and four feet high.

After the fire of 1842, Mr. Curtis immediately rebuilt the machine shop (52 x 30 feet), three stories high. In 1842 he built a factory on the site of the old Hale mill, a portion of which he leased to Sumner Pratt, to make cotton sewing thread. Mr. Curtis afterwards had an equal interest with Mr. Pratt, and bought him out in 1844. The basement of the building was rented to L. & A. G. Coes, who manufactured wrenches. While Mr. Sumner Pratt was here in the thread business, Mr. L. J. Knowles and a Mr. Hapgood purchased his product and spooled it in another room of the same building, and put it on the market.

After Mr. Curtis bought out Mr. Pratt, he put in looms for making cotton sheetings. The mill was continued as a cotton-mill for several years, when it was converted into a satinnet-mill. In 1845 the South Mill was built and used for the manufacture of cotton sheetings and drillings.

In 1870 the South Mill was changed to woolen goods, blankets, shawls and dress goods.

At the north end of Curtis bridge was the old wheelwright shop of E. Graves, now used as a dwelling-house. Mr. Curtis bought out Graves in 1837, and continued the wheelwright business until about 1840.

In 1852 Mr. Curtis bought the Trowbridgeville factory and commenced here the manufacture of cotton

sheetings. In 1860 the mill was burned and partially rebuilt and filled with machinery for making woolen goods.

Mr. Curtis changed the 1845 mill to woolen goods in 1871, and has since put in additional machinery for the manufacture of horse blankets.

The mill built in 1842 was changed to satinets in 1857. In 1862 Mr. Curtis took Edwin T. Marble into partnership in his business for manufacturing woolen machinery for finishing woolen, silk and cotton goods, and that partnership has continued to the present time.

This company makes a specialty of shearing machinery, the improvements in which have been greater than in any other machinery used in the manufacture of woolen goods. Mr. Curtis built the first machines for shearing or trimming cotton cloth built in this country; they were used to remove the fuzz from cotton cloth. In old times this was accomplished by singeing or burning.

A shearing-machine made in France was sent from Pawtucket to Mr. Curtis to be repaired. Mr. Curtis examined it and thought it could be improved. He began building the machines then and has continued ever since. Up to that time the French machines had been used in this country. They had one set of shears; the Curtis machine now has from two to five sets. One machine made at the present day will do as much as twelve did in 1830.

December 10, 1833, William H. Howard and Silas Dinsmore made cotton and woolen machinery at their machine shop near the Court-House, and continued in business until September 30, 1834, when they dissolved. In November, 1834, Silas Dinsmore commenced the manufacture of power-looms at the same place, and April 13, 1835, formed a co-partnership with Fitzroy Willard, continuing in the same business. In 1838 Fitzroy Willard was located at Court Mills, where he manufactured broad power, satinnet and cassimere looms, and in 1840 Silas Dinsmore manufactured reeds at Court Mills.

The card-clothing industry has been a most important one, and was naturally among the earliest in which the colonists engaged, for the reason that it is essential to the manufacture of textile fabrics. The use to which carding is put is to separate the fibres of the material being worked, and to lay them parallel. The process consists in the reciprocal motion of two surfaces covered with short pointed teeth, between which the stock is placed. Formerly this was done by hand, and was conducted in the household.

"It is probable that either cards proper, or tools closely resembling them, were used as far back as the dawn of civilization, when the art of the manufacture of textiles was in its very infancy. To within a comparatively recent period the processes were very rude, depending mainly on hand labor, and thus the cards employed differed somewhat in their shape from those used at the present day.

*Albert Curtis*

"To produce them, a sheet of leather was taken about eighteen or twenty inches by about four inches in width. This was ruled by lines into cross sections as a guide for the workman, who used a pricker with two blades, piercing two holes at a time at the point where the lines intersected until the whole sheet was pierced. This accomplished, the wire was taken, each pin or shaft being separately bent into a staple by hand. The prongs of the staples formed the card teeth, which were inserted also by hand, one staple at a time, into the perforated leather sheet above described.

"The sheet, with its wire teeth, was now nailed upon a board, and called a card. With this appliance, or rather with a pair of them, the operator carded. He placed tufts of cotton, wool or other fibre between them, and drew the one over the other for several strokes until both were equally filled, and then, by a reverse stroke, he cleaned out the fibre in the form of a roll, called a carding, which was used by the spinsters for making their yarn."

Tacks were first used in making hand-cards, and they were for a time manufactured in this country by cutting them out of sheet-iron with a pair of shears. The tack was held in a vise and headed by a single blow. About six hundred and fifty tacks were required for nailing each dozen pairs of hand-cards to the boards on which they were used. All the tacks used for this purpose for many years were made by hand in the manner described above, until Thomas Blanchard, of Sutton, invented an automatic machine for making the tacks from strips of sheet-iron.

Daniel Denny, whose card-factory has been noticed, probably followed the practice of giving the teeth out to women and children, who would set them in the leather at their homes.

Card-setting by hand was done as late as 1828. Earle & Chase, whose store was at the corner of Thomas and Main Streets, state in August, 1826, that persons who wish for cards to be set can be accommodated at their store. In 1829 the average price paid for setting cards by hand was forty-two cents per square foot. A good setter would put in about twenty thousand teeth in a day. The best machines to-day will set three hundred teeth per minute, at an average cost of five cents per square foot. Wages paid card-setters in 1829, \$1.33 per day; at the present time, \$3.50 to \$4.50 per day. The cost of setting cards is now something less than one-eighth the amount paid sixty years ago, and the wages paid average three times as large.

Amos Whittemore, of Cambridge, had patented a card-setting machine in 1797, but it could not be used by others, and the cards made by hand at Leicester were of better quality.

In 1785 the manufacture of cards was begun in Leicester, and to this industry the growth and prosperity of the town is largely indebted. In 1789

Pliny Earle, who had manufactured hard-cards since 1786, made for Almy & Brown, of Providence, R. I., the first machine card clothing in America, as appears from the following interesting letter :

PROVIDENCE, 11th M. 4th, 1789.

RESPECTED FRIEND,

PLINY EARLE.—We having pretty much concluded to alter and to cover our Carding Machine, and Joseph Congdon informing us that he expected to go to Leicester soon, we thought we would inclose & send thee the Number & diameter of our Cylinders and propose thy covering them with Cards. We have conferred with our Card Makers in Town about doing the Jobb, who appear desirous to do it, and are willing to take their pay, all excepting the cost of the wire in our way, but, it being our object to have it well done, and thinking we could rely upon thy performance, have preferred thy doing it.

We have also had it in contemplation to write to Boston, but, being desirous of having it done soon, and that being likely to protract the time of having it done, have waived that also.

We are not desirous of beating thee down in thy price, or that thou should do it below what thou could reasonable afford, but we have thought, considering thou hast thy machinery now prepared, which was not when thou did that for the company at Worcester, that if we gave thee the same for covering ours as thou had for theirs, tho' a little larger, it would be equivalent to what thou charged them, considering the preparations aforesaid, which the first employers, or rather those on whose account it is especially made, in all such cases must expect to pay, as we have had abundant experience. If that price will answer, we should be glad thou would take the pains to go and view the machine at Worcester, and if there can be any improvement made upon the manner of covering, that, should like thou would make it, either in the Length of the Teeth, or in any other particular. Stowel, who superintends the business there, will cheerfully give thee any information respecting the working of theirs, no doubt, upon thy own account and upon ours also, as we are upon friendly terms with him, having divers times been mutually helpful to each other.

We are much in want of ours being done, and should be glad to have it soon; propose, therefore, if thou undertakes the business, that thou would set a time when thou thinks thou could bring the cards down to put on, and we will endeavor to have the machine in readiness to receive them. Inclosed is the dimensions of the Cylinders, that is, their diameters; the second Cylinder in circumference, thou knows, has the cards placed at some distance from each other, in order that the rake may take the rolls of distinctly; ours are about 2½ inches apart.

We are of the opinion that the bind of the teeth ought to be in proportion to the circumference of the Cylinder on which they are placed. We propose having the Cards the same size as those on the Worcester machine, viz.: 16 Inches and all Cotton Cards of equal quality excepting the feeder, and the Cylinder that takes it off of it, and we need not add of the best quality of the number suitable for the machine, of which, we suppose, the machine at Worcester must be considered as a sample. We should be glad to supply thee with any kind of live Stock, if thou should want, at Cost price, or any kind of produce, cloths included, for the whole or part of the amount; if not, we will pay thee the cash. We think that in four weeks from this time we shall be glad of the Cards. A line from thee by Joseph respecting what we may depend on will be agreeable, as we mean to prosecute the accomplishment of the business as fast as may be.

From thy Friend, ALMY & BROWN.

P. S.—The diameters of our Cylinders are here subjoined.

The great Cylinder.....	36	Inches.
the next.....	26	"
the next.....	10½	"
1 ditto.....	10	"
4 ".....	6	
6 ".....	3	

One of which, the feeder, to be covered with wool Cards.

It has been often said that the first machine card-clothing was made for Samuel Slater in 1790. Mr. Slater landed in New York November 11, 1789. December 2, 1789, he wrote to Almy & Brown, and December 10th received a reply, making an engagement with him. December 14th Pliny Earle set out for

Providence to put cards on Almy & Brown's machine. There is no doubt that Mr. Slater had much to do with perfecting the carding-engine and making it a success after he went into the employ of Almy & Brown.

(I am indebted to Mr. Thomas A. Dickinson, of the Worcester Society of Antiquity, for this information and copy of above letter.)

The leather first used in making machine-cards was calfskin, and then cowhide tanned for the purpose. Sheepskin was generally used for hand-cards.

In 1791 Mr. Earle's brothers—Jonah and Silas—became associated in business with Pliny, and in 1806 Silas commenced to manufacture on his own account. At his death his son, Timothy, sold his father's machinery to his cousin, Timothy K. Earle, and Reuben Randall. Mr. Randall's interest, after some transfers, came into the hands of Edward Earle.

Timothy Keese Earle, founder of the T. K. Earle Manufacturing Company, was born in Leicester in 1823. In December, 1843, Timothy K. Earle & Co., consisting of Timothy and his brother, Edward Earle, moved from Leicester to Worcester, and occupied room over Pratt & Earle's iron store, in Washington Square, where they continued the manufacture of all kinds of machine-cards of the best quality. Their machines were built by William B. Earle, between 1843 and 1849.

In 1857 T. K. Earle & Co. built the factory now occupied by their successors for the manufacture of card-clothing cotton, gin-clothing and belting. This has always been the largest card-clothing factory in America.

Edward Earle retired from the business in 1869, and was succeeded by his brother Thomas, who died in 1871. In 1872 Mr. Edwin Brown became a partner, and subsequently, in 1880, the agent and treasurer of the T. K. Earle Manufacturing Company, of which Mr. T. K. Earle was the president.

The T. K. Earle Manufacturing Company own a number of patents on their improvements in the method of producing card-clothing. Pliny Earle made one kind of card-clothing, viz.: iron wire teeth set by hand in leather. The T. K. Earle Manufacturing Company now make all kinds of leather card-clothing, using both hemlock and oak tanned leather, over ten varieties of cloth card-clothing, and use eighteen or more sizes of soft steel wire, eleven or more sizes of hardened and tempered steel wire, besides tinned wire and brass wire of various shapes and sizes. They curry their own leather, manufacture card-cloths and rubber-faced card-cloths for themselves and for other card-makers. They have built almost all their card-setting machines in their own machine-shop, and are constantly making improvements in the quality and the methods of card-clothing.

The T. K. Earle Manufacturing Company of Worcester, Mass., have manufactured double and single

cover cloth for foundation for card-clothing for the past fifteen years, having special and improved machinery for the purpose, and in 1883 they built a factory on their premises for the manufacture of all kinds of card-cloth, including vulcanized rubber facings. With the very best American and English machinery, and the most improved process of vulcanizing rubber for this purpose, they are now prepared to furnish not only their own large card-clothing factory with card-cloths, but have sufficient capacity to make them for all the card-makers in America.

In 1866 Joseph B. and Edward Sargent, sons of Joseph B. Sargent, the manufacturer of card-clothing in Leicester, organized the Sargent Card-Clothing Company, and built a factory in Worcester, with Edward Sargent as manager. April 15, 1879, the business was sold to James Smith & Company, of Philadelphia.

Howard Bros. Manufacturing Company, Washington Square, manufacture machine card-clothing, machine wire heddles, hand stripping cattle and curry cards. Established in 1868, by C. A. Howard, A. H. Howard and John P. Howard, continued as a co-partnership until 1888, when the company was incorporated as the Howard Bros. Manufacturing Company, with a capital of forty-five thousand dollars.

They started with four hands, and now employ twenty-two, and occupy ten thousand square feet of flooring. They have a lumber-mill at Keyes, N. H., where they make the backs of their cards. Their machinery is all of their own construction, and much of it special machinery of their own design, notably the card-setting machines, employed for setting teeth, in the cards of which there are from forty thousand to eighty thousand in each square foot of card-clothing. One feature of this business is the manufacture of diamond-pointed card-clothing and hand stripping cattle and curry cards of every description in wood and leather for cotton, wool and flax. Their trade extends throughout the United States and Canada.

Charles F. Kent started the business of manufacturing card-clothing in January, 1880.

There appears to have been a number of small manufacturers of cards in Worcester at different times. Daniel Denny and Earle & Chase have already been mentioned. In 1834, William B. Earle had room in Howard & Dinsmore's shop, near the Court-House, for the manufacture of cards.

In 1848, William E. Eames, 43 Front Street, manufactured cards; he was succeeded by Earle Warner.

In 1849, N. Ainsworth occupied the third story of Goddard & Rice's shop in the manufacture of card-setting machinery. The business was purchased by F. G. Ruggles in 1851.

David McFarland at this time manufactured card-setting machinery, and made the best machines then made in the country. All the machines now running

Edwin Earl

*Timothy R. Earle*

in the Sargent Card-Clothing Company factory, excepting a few English machines, are the McFarland pattern.<sup>1</sup>

**LOOMS.**—"Weaving is the art by which threads of any substance are interlaced so as to form a continuous web. It is perhaps the most ancient of the manufacturing arts, for clothing was always a first necessity of mankind.

"The simplest form of weaving is that employed in making the mats of uncivilized nations; these consist of single untwisted fibres, usually vegetable, arranged side by side to the width required, and of the length of the fibres themselves, which are tied at each end to the stick which is so fixed as to keep the fibres straight and on the same plane; then the weaver lifts up every other of these longitudinal threads, and passes under it a transverse one, which he first attaches by tying or twisting to the outermost fibre of the side he commences with; and afterward, in the same way, to that on the other side, when it is passed through the whole series. The accession to the art of spinning threads of any length enables more advanced nations to give great length to the warp, or series of threads which are first arranged and to pass the weft, or transverse thread, backward and forward by means of a shuttle without the necessity of fixing at the sides. That kind of weaving which consists of passing the weft alternately over and under each thread of the warp is called plain weaving; but if the weaver takes up first one and then two threads alternately of the warp series, and passes the weft under them for the first shoot of his shuttle, and raised those which were left down before for the second shoot, he produces a cloth with a very different appearance, called twill.

"There are few arts which require more patience than weaving; as many as from one to two thousand threads often constitute the warp, and these threads may be so varied in quality as to produce many varieties of fabric. From that cause alone there are almost infinite variations; many may be produced by the order in which the threads are lifted for the passage of the weft; that of itself can also be varied as much or more in its quality and other circumstances, so that the inventive genius of the weaver finds incessant opportunities for its display, and nice arithmetical calculations are required in estimating and allotting the numerous threads to the endless variety of patterns which are constantly passing through the loom."<sup>2</sup>

The first practical power-loom was devised in 1785 by Dr. Edmund Cartwright, of Derbyshire, England, a minister of the Gospel, and ignorant of mechanics. He is said to have had his attention turned to the subject by the remark that when Arkwright's patents for spinning yarn by power should have expired, so

many persons would go into the spinning business that no hands would be found to weave the cotton. He spent thirty thousand pounds in endeavoring to perfect his loom, and in 1808 received a grant from Parliament of ten thousand pounds for his services. Steam-power was applied to his looms in 1807.

Improvements were rapidly made upon the Cartwright loom by other inventors, and it was soon brought into general use for both cotton and woolen goods.

Ichabod Washburn speaks in his Autobiography of seeing a power-loom in the winter of 1813-14, which was so crude that all the cog-wheels were made of wood, and expresses the opinion that it was probably the first power-loom in the United States. Whether this be true or not, it is certain the power-loom had not, at that time, been long in operation in this country.

In the fall of 1823, Wm. H. Howard and Wm. Hovey were in business together, and after building various kinds of machinery, commenced building broad power looms, and finally settled on the common Scotch looms as the best, and put them in operation at the factory of the Goodell Manufacturing Company, Millbury, at the Pameacha factory in Middletown, Conn., at the Torrington and Litchfield factories, and elsewhere.

This partnership was dissolved, and early in 1825 each manufactured these looms on his own account, William H. Howard building broad power cassimere and kerseymere looms, carding and shearing-machines at his shop, one mile south of the Main Street in Worcester,—South Worcester privilege.

For satisfactory proof of the superiority of his looms, he referred to the Goodell Manufacturing Company in Millbury; to Wolcottville Manufacturing Company, in Torrington, Conn.; and to Zachariah Allen, Providence, R. I.

These looms were sold for one hundred and twenty-five dollars each, delivered at the shop in Worcester, including the expense of putting them in operation.

In 1828 Rice & Miller advertised for sale satinet power-looms, and in 1830 Wheelock & Prentice took the shop theretofore occupied by William H. Howard, at South Worcester, and purchased of him the right to build his improved looms, upon which he had a patent for an improvement in the lay motion, consisting of an irregular slot in the sword of the lay through which it was moved. There are many looms now in operation with this movement.

In 1832 Horatio Phelps carried on the loom business at the shop formerly occupied by William H. Howard, having purchased the right to make and sell the Howard Improved Patent Broad-loom.

The business was conducted at the same place in 1833, by Phelps & Bickford, who advertised that they were prepared to build to order all kinds of woolen looms of the most improved plan. In addition to the

<sup>1</sup> Much of the material used in the article on card-clothing is taken from a book called "A Century Old," published by the T. K. Earle Mfg. Co., and written by H. G. Kittredge and A. C. Gould.

<sup>2</sup> People's Encyclopædia.

business of making the broad satinet cassimere power-looms, they manufactured to order reeds of any description.

Prescott Wheelock was building looms at his shop in New Worcester in 1833, of any description that the public might want, and in 1835 Silas Dinsmore and Fitzroy Willard formed a copartnership to manufacture power-looms; they dissolved in November, 1835, Fitzroy Willard continuing the business at the same place in Court Mills, where he manufactured broad power satinet and cassimere looms. He built fifty broad power looms in Worcester for W. & D. D. Farnum, and Mr. Samuel Porter helped set them up in the mill at Blackstone, in 1835. Most of the machinery for that mill was built in Worcester. Henry Goulding constructed the carding and spinning-machines.

All the looms which have been spoken of up to this time were plain looms, so-called, the fancy loom being an invention of later date. The plain loom is one in which a few harnesses, operated by cams, are used. The goods woven on this loom are like cotton or twilled fabrics.

The modern fancy loom varies in range from two to forty harnesses. The movement of these harnesses is controlled by a pattern-chain, made up to correspond with the different make of goods, and for different colors of filling in the goods, drop-boxes, or movable boxes are required, which are also controlled by chain, according to the pre-determined pattern. With these boxes from one to seven colors can be used.

In the trade at the present time the cam-loom, with a single box, whether of two or eight harness capacity, is usually spoken of as a plain loom, and any loom whose mechanism is controlled by chain made up according to a pre-determined pattern, is usually spoken of as a fancy loom.

Up to 1836 the harnesses of all power-looms were operated by cams; consequently the changes of weave of which the looms were capable were very limited, and goods for which an intricate figure or design was required were necessarily woven, as formerly, in a hand-loom.

In 1836 William Crompton, a native of Lancashire, England, a practical weaver both by hand and power, came to Taunton, Mass., and entered the service of Messrs. Crocker & Richmond.

While in the employ of that firm Mr. Crompton invented a loom to weave a certain pattern of goods which the looms in the mill could not weave, for which a patent was issued to him in 1837, and the loom was introduced into the manufacture of cotton-goods. This loom was the first power-loom invented in which the figure or pattern desired to be woven could be made up in a small chain, and when placed upon the loom would control suitable mechanism to move the harnesses to weave the proper figure. Mr. Crompton went to England and procured a patent for

his loom in that country, and in 1839 he returned to the United States, and in 1840 introduced his invention into the Middlesex Mills, in Lowell, Mass. Up to that time no fancy woolens had been woven by power in this country or in Europe, except those woven on hand-looms.

In a letter written in 1877 to the late George Crompton, Esq., by Mr. James Cook, agent of the Middlesex Mills in 1840, the following interesting statement is made:

The writer, now in his eighty-third year, in looking over a lot of old samples, came across a piece of fancy woven cloth, the very first woven in this country by power; and the idea crossed his mind that it might be interesting to you to learn the beginning of this great revolution in the fabric now in use very generally in this country to the extinction of the plain fabrics formerly used to a great extent.

Your father came to the Middlesex Mills in this city from Taunton, and represented to the writer and Mr. Edward Winslow, now deceased, a machinist in the employ of the Middlesex Company, that he had a loom at Taunton for weaving fancy cottons which he thought might be applied to woolen fabrics. The cotton loom was sent for by the Middlesex Company. Mr. Winslow and myself altered one cassimere loom with the assistance of your father, who was good mechanic, by putting on Crompton's patent. The experiment was an entire success; the alteration was extended very soon to all the cassimere looms and then to the broad looms, so that the whole of the weaving power of the mills was in that direction.

Mr. Samuel Davis states that soon after this, happening to be in Boston, he accidentally met Mr. Crompton at an hotel there, who told him about his loom. Mr. Davis was then building carding and spinning-machines in the old Court Mills, and Mr. Crompton stated to him that he wished to get some one to build his loom; that he had been to Lowell and Lawrence; also to Dedham, but thought that he should close the contract at Lowell. Mr. Davis said he was not building looms, but that Worcester would be a good place to have the looms built, and that Phelps & Bickford would be good parties to undertake their manufacture.

Mr. Crompton came to Worcester and was introduced to Phelps & Bickford, who were then building plain looms. Phelps & Bickford made an arrangement with Mr. Crompton to build his looms upon a royalty, and continued doing so till the expiration of the patent.

In February, 1844, the mill at Northville, owned by Ichabod Washburn, F. W. Paine, G. A. Trumbull, and occupied by William Crompton, was totally destroyed by fire.

In 1848 William Crompton lived in Millbury, where he was engaged in the manufacture of woolen and cotton goods, and where he also had a machine-shop. April 12, 1848, he advertised to sell various kinds of tools used by him in the manufacture of machinery, as he had determined to confine himself to the manufacture of cotton and woolen goods.

Mr. Crompton later removed to Connecticut, where his son, George, worked in Colt's factory. The Crompton patent, meantime, had expired; but it was renewed for seven years, and George Crompton came to Worcester, and associated himself with

*George Thompson*

Merrill E. Furbush for the manufacture of looms, first locating in Merrifield's building, where they remained till the fire of 1854.

After occupying for a short time quarters in the wire-mill in Grove Street, they hired the Red Mill, near the foot of Green Street, employing about fifty hands in the manufacture of the Crompton loom.

At this time William M. Bickford, the successor of Phelps & Bickford, employed twenty-three hands in the west wing of the Grove Street mill in building looms.

August 1, 1859, Furbush & Crompton dissolved. Mr. Crompton continued the business, buying the Red Mill property, and in 1860 erected a new building, which was a substantial brick structure, one hundred and ten feet long by fifty feet deep, three stories high, besides the attic, exclusive of an ell for an engine-house.

Mr. Crompton at that time employed sixty hands, which number he expected to increase to eighty as soon as buildings could be erected.

The successive improvements in the Crompton loom can best be given by a quotation from an interesting pamphlet on that subject, published by the Crompton Loom Works in 1881: "Furbush & Crompton made narrow looms from 1851 to 1857, when they brought out a fast-operating, Broad fancy loom, with improvements in box-motion. Broad looms, up to this period, operated at about 45 picks; the new 1857 Broad looms, with twenty-four harnesses and three boxes at each end, reached a speed of 85 picks per minute. This was a great stride in production; no advance has been so great since then. The narrow fancy cassimere loom, with three boxes at one end, up to this time had not obtained the speed of 85 picks per minute; but with important improvements in the reverse motion, the simplification of devices for operating the lays by means of the ordinary cranks, the use of the ordinary narrow shuttle and the reduction of the size of the shed made a fast economical Broad power-loom of 85 picks a possibility. One weaver could attend one Broad loom as readily as one narrow; therefore 'broads' at once came into favor and use, and the comparative exclusion of narrow looms was foreseen.

"Furbush & Crompton built looms until 1859, when the partnership was dissolved. The patents granted to and owned by the firm were in part for improvements in double reverse motion, E. W. Brown's invention, of which they were the sole owners; said patents were by mutual agreement territorially divided—the New England States and the State of New York to Crompton, and the remainder of the country to Furbush, and by said agreement Furbush was debarred from making looms of any kind whatever in Crompton's territory."

In December, 1860, William M. Bickford moved his factory to Exchange Street, in Merrifield's building, where he was prepared to build all kinds of Crompton

looms and other fancy looms, broad and narrow. This led to a lawsuit which resulted in Bickford's being found to be an infringer of the Crompton patents. On his death, in 1863, the business went out of existence, the patterns being sold to the Crompton Loom Works. Various improvements, many of them patented, have been made from time to time, Mr. Crompton having taken out over one hundred patents in the United States, besides a large number in foreign countries. A number of patents have also been taken out by Mr. Horace Wyman, superintendent for many years of the Crompton Loom Works.

The Crompton Loom Works have thus grown until it is one of the largest manufacturing establishments in Worcester.

Mr. George Crompton died 1886, and the business was incorporated January, 1888, with the following officers: M. C. Crompton, president; Horace Wyman, vice-president and manager; Justin A. Ware, secretary and treasurer.

Mr. L. J. Knowles was born in Hardwick, July 2, 1819, and was, in 1836, clerk in a store in Shrewsbury.

In June, 1842, we find the following notice:

"We were shown some miniatures taken by Mr. Knowles at his room in Brinley Row, which we think for beauty, boldness and distinctness, exceed anything we have seen."

In February, 1843, L. J. Knowles & Co., in connection with their daguerreotype business, advertise to do electro-gilding and silver-plating.

In 1844 Sumner Pratt leased a portion of one of Mr. Curtis' buildings, at New Worcester, for the manufacture of cotton sewing-thread. Mr. Knowles and a Mr. Hapgood had quarters in the same building, and purchased thread of Mr. Pratt, which they spooled and put on the market.

In 1847 Mr. Knowles commenced the manufacture of cotton warp at Spencer, and in 1849 removed to Warren. During the years 1855 to 1858 he was engaged in the manufacture of satinets in Warren, and made some improvements on the looms he was then running, for two of which he took out patents in 1856—one for a close shed cam-jack for harness motion, and the other for separate picker for each cell in the drop-shuttle box. In 1857 he constructed a drop-box mechanism, for operating drop-boxes by means of cranks set at the opposite extremes of their throw, under the direction of a pattern-chain, or its equivalent. This was the germ of the mechanism of the fancy loom, which has developed by successive stages into the loom as built by the Knowles Loom Works at the present day.

L. J. Knowles and his brother (F. B. Knowles) began the manufacture of looms for sale under the firm-name of L. J. Knowles & Brother, at Warren, Mass., in 1862, and the first looms were made for hoop-skirt tapes, with woven pocket for the wires, and for bindings, tapes, etc. The loom was patented in 1863.

This branch of the business continued till the fall of 1866, when the company removed to Worcester, Mass., occupying Dr. Sargent's Block—Allen's Court. During 1866 the company began the manufacture of cam-looms for satinets, doeskins and other plain goods, and patented a cam harness motion for this loom in November, 1866.

In 1868 they began to make these looms with drop-boxes at each end, so as to use different colors of filling for checks, plaids, etc. In 1871 they began to make the drop-box looms, with chain or fancy harness motion, so as to extend the range of looms according to the requirements of the patterns. Out of this grew the fancy, woolen loom of the present style, the first one of which was built in 1872, and sold to the Jamesville Mills, of this city.

In the spring of 1873 the first broad loom of this style was made from new and heavy patterns, and from that time many thousands have been built for the woolen-mills of the country. This loom was patented in 1873. Meantime, the loom business had grown so that in 1876 from seventy-five to one hundred men were employed. The loom was shown at the Centennial Exhibition at Philadelphia, and as a result won for itself a wide reputation. A forty harness loom was made in 1876, and the first one was shown at this exhibition, and a number of them were sold.

In 1879 the business had grown to such proportions that it was necessary to have more room, and the company, in October of that year, moved to what was known as the Junction shop, where the business has continued till the present time, and preparations are being made for the erection of a much larger factory, in order that proper facilities may be secured for the rapidly increasing demands of the business.

In 1884 Mr. L. J. Knowles died very suddenly, in Washington, and the business was conducted by the surviving brother, Mr. F. B. Knowles, until the 1st of January, 1885, when a stock company was formed under the name of the Knowles Loom Works, with Mr. F. B. Knowles as president, which has continued the business under the same general management. In 1885 the company brought out a very heavy loom of thirty harness capacity for weaving worsted goods, which has been very largely introduced. Of this loom they have built and delivered the largest single order for heavy woolen looms ever given in this country, namely—two hundred and four looms for the Riverside and Oswego Mills, of Providence, R. I.

The old hoop-skirt loom has gradually developed into a loom for silk ribbons, suspenders, bindings and all kinds of narrow goods, with great success.

Within a few years the company has perfected and put upon the market looms for weaving flannels, dress-goods, fancy cottons, etc., and large numbers of them have been put into the best mills.

They have also recently brought out various looms designed for gros-grains, satins and the various kinds

of silk goods, plain or fancy; also coverings for upholstery work, portières, draperies, etc., for silk velvets, mohairs and silk plushes; and have probably made the widest looms for fly shuttles ever made, having a reed space of two hundred and thirty-six inches.

They have also introduced, within a few years, a power-loom for ingrain carpets, many of which are now running in the best carpet-mills in the country, and are giving perfect satisfaction.

All the Knowles looms are built on the open shed principle, which is their distinctive feature.

The value of the Knowles loom has also been recognized in Europe, and elsewhere, where it is being largely introduced by Messrs. Hutchinson, Hollingsworth & Co., of Dobercross, England, who are building them in large numbers and already have several thousands of them in successful operation.

The Gilbert Loom Company, Charles W. Gilbert, proprietor, was established in 1866, and is situated at 186 Union and 33 North Foster Streets, Worcester. They employ about fifty hands, using steam-power from a ninety horse-power engine, and are building looms and machinery as follows:

Looms for the weaving of tapestry, Brussels and velvet carpets, mohair and cotton plushes, fancy woolen (twenty-four harness, four drop boxes) for woolen and worsted goods. Fancy cotton looms, gingham looms, coach lace looms, satinnet flannel, blanket, jean and cassimere looms, gunny cloth and pine fibre looms, tape and narrow wire looms for No. 20 and finer wire, cam looms for chairs and car-seats, heavy looms for cotton duck and belting, needle looms for wipers and sugar strainers; and, in addition to looms, they also build yarn-printing drums and belting frames for tapestry and velvet carpets, cop winders for jute, wool, linens and cotton, yarn spoolers, mill shafting, gear cutters and harness frames; they are also designers and builders of looms for new and special purposes.

In 1854 Rodney A. N. Johnson & Co., composed of Mr. Johnson and Daniel Tainter, manufactured spinning machinery for wool carding machines, pickers, twistors, spools, bobbins, boring machines, card clothing, etc., at Merrifield's Steam Mill.

In 1859 Fox & Rice manufactured fancy cassimeres on the stream at the junction of Green and Water Streets, employing two hundred hands and manufacturing fifty thousand yards of cloth monthly. Daniel Tainter, at the same time, employed thirty hands in Union Street in the manufacture of wool-carding machines and jacks.

The business now conducted by the Cleveland Machine Works Company, the well-known builders of woolen machinery, located at 54 Jackson Street, was established in January, 1860, by Mr. E. C. Cleveland, who commenced the manufacture of woolen machinery in Central Street in what was then known as Armsby's building. He manufactured cloth dryers,

*L. J. Knowles*

*G. B. Knowles*

hydro-extractors, cloth-brushing machines, jacks, presses, fulling-mills and wash-mills, and continued in this business until early in 1863, when, in addition to the above-named machines, he built the first set of the well-known Cleveland cards, which are used for converting wool into roving previous to spinning. These cards were sold to Messrs. Howe & Jefferson, of Jeffersonville, and are now running in the mill of the Jefferson Manufacturing Company, and doing good work after twenty-six years of service.

About this time the late John C. Mason and Mr. J. M. Bassett were admitted to the firm. They, after several years, withdrew, and Mr. Cleveland continued the business until his death, which occurred April 28, 1871. Since the building of the first set of cards hundreds of sets, with improvements from time to time, have been built, and are now in successful operation in first-class mills.

Since the death of Mr. Cleveland the firm has been managed by Mr. S. W. Goddard, who has introduced many new machines and many improvements in the machines made previously. They now manufacture about fifty machines for different uses in woolen mills, making a specialty of all kinds of cards for wool, worsted, felt and shoddy; also twisting, roving, spooling, picking, drying and cloth finishing machinery. The product is sold throughout the United States, Canada and Mexico.

In February, 1863, the late Hon. Isaac Davis sold the lower Junction shop, built by Eli Thayer in 1854 for gun work, and used in 1861 for soldiers' barracks with twelve acres of land, to Jordan, Marsh & Co., of Boston, who intended to convert it into a woolen-mill, with sixteen sets of machinery, making it one of the largest woolen-mills in the State. This shop was first known as the South Junction shop; later, as the Pistol Shop Barracks and Adriatic Mills. Jordan & Marsh made extensive improvements. The main building was four hundred feet long, forty feet wide and two stories high. The second floor was devoted to carding and spinning, and was arranged for twelve sets of cards and twenty packs of four thousand eight hundred spindles. The first floor was for finishing and weaving; the weaving all to be done by looms made by George Crompton, of Worcester. The main belt was one hundred and fourteen feet long, and thirty inches wide, double throughout, and made at the shop of Graton & Knight in Front Street. Particular attention was called to this, as showing that the equipment of a woolen factory could be procured in Worcester; the cards, jacks, dryers, dressers, extractors, hydraulic presses, etc., were furnished by the Cleveland Company.

This mill is now owned by the Worcester Woolen Company, incorporated in 1881. The building is now five hundred and eighty-two feet long, forty-two wide, two wings—one seventy-two by sixty, the other ninety by fifty-six. The number of the hands, at the beginning two hundred, is now two hundred and

thirty. They have thirteen sets of cards, fifty-eight broad and two narrow looms, and twenty Bancroft operators. They make fine woollens, cassimeres and suitings, and produce from five thousand to eight thousand yards per week, the annual sales amounting to six hundred thousand dollars. The present proprietors, the Messrs. Legg, came from Rhode Island. March, 1881, James Legg, Jr., became the owner of the mill, and it was run under the name of James Legg, Jr., & Co., until July, 1881, when the present firm, James & John Legg, succeeded.

The Alma Woolen-Mills, in Green Street, employ two hundred hands in the manufacture of fancy cassimeres and suitings, running fifty-nine looms and eight sets of cards with attendant machinery.

The firm of Johnson & Bassett, manufacturers of self-operating mules and jacks, was established in 1870.

In 1868-69 experiments looking towards making the jacks self-operating were going on in several parts of the country, and were being conducted in the shop of Cleveland & Bassett, in Worcester, by Edward Wright.

The failure of Cleveland & Bassett in the fall of 1869 brought Mr. Wright's experiments in their works to an end, but he arranged to go on with Johnson & Co., jack builders, and July 1, 1870, the copartnership was formed between Johnson & Bassett. The first self-operating attachment for jacks of their make was put at work in the mill of John Chase & Sons, at Webster, in 1870, since which time Johnson & Bassett have built up an extensive business in the manufacture and sale of self-operating heads for application to hand-jacks, self-operating jacks complete with heads, and self-operating mules. The business was located in the Merrifield Buildings, 180 Union Street, until October 1, 1886, when it was removed to Mr. Bassett's new building, corner of Foster and Bridge Streets.

The Crompton Carpet Company was organized in 1870 by George Crompton, who, with the superintendent, Horace Wyman, invented and patented a loom for weaving Brussels carpets by power, there being at that time no power loom for that purpose, except the Bigelow loom and two makes of English looms, the right to use which could not be obtained in this country. The manufacture of Brussels carpets, therefore, was confined to the Bigelow Company at Clinton, and the greater part of the carpets used in the United States was imported from England, and a high price was consequently maintained. Mr. Crompton associated with himself in the enterprise Dr. Joseph Sargent, William Cross, Horace Wyman, W. W. Rice, William H. Jourdan and Calvin Foster—George Crompton being president of the company; William Cross, treasurer; Joseph Sargent, Jr., agent, and M. J. Whitall, superintendent. After the death of Mr. Cross, Joseph Sargent, Jr., was elected treasurer.

They commenced operations with sixteen looms of Crompton make. The factory was located in South Worcester and was a two-story building, French roof, 115x60, run by water-power, the amount being estimated at one hundred horse-power. In 1871 a dye-house was added to the mill (which stood near the site of the old White & Boyden mill, burned August, 1863, and referred to previously). This enterprise was the beginning of the general manufacture of Brussels carpets in this country. Other companies were soon formed, the restrictions were removed from the sale of the English-made looms, and, in consequence, the price of carpets rapidly declined from three dollars per yard in 1870 to one dollar per yard in 1879.

The company started with one hundred and fifty thousand dollars capital, and, before their operations ceased, had increased the number of their looms from sixteen to thirty-six, and continued until 1879, when the machinery was sold to W. J. Hogg, Sr., of Philadelphia, and later the building containing the carpet machinery was leased to Mr. Hogg.

The Packachoag Worsted and Yarn-Mill was built and owned by Mr. George Crompton. This mill was near the Crompton Carpet Company, and was managed by Joseph Sargent, Jr. In the yarn-mill they started with twenty-four spinning frames and accompanying machinery; later, Mr. Crompton built another yarn-mill adjoining the first. The first Packachoag Mill was burned in 1884; loss, one hundred and eighty-one thousand two hundred and seventy-five dollars. After the fire Mr. Crompton sold the land and the ruins of the Packachoag Mill in part to Mr. M. J. Whittall and in part to William James Hogg, Jr.

Mr. Whittall, who was superintendent of the Crompton Carpet-Mill from the commencement of business, was from Stourport, England, where he was manager of the Severn Valley Carpet Works of Fawcett & Spurway. In 1879 Mr. Whittall returned to England, and while there purchased eight Crossley Carpet Looms. He brought these to this country, and began to operate them in a building leased of the Wicks Manufacturing Company. In 1882 another story was added, and Mr. Whittall added eight more carpet-loom; but business increasing, more room was needed, and he determined to erect a building for himself; and in 1883 bought of Mr. Crompton a piece of land facing Mr. Crompton's original carpet-mill, and erected a building one hundred and seventy-five by sixty feet, two stories in height. This mill was finished during that year, and the machinery from the Wicks building, together with fourteen new carpet-loom, was put into operation. In 1884 an extension was added, together with twelve looms, making forty-two in all.

It will be recollected that Mr. Whittall had purchased part of the land and all of the buildings that remained of the Packachoag Mill property, and on this spot he erected another carpet-mill, and also repaired the old yarn-mill, engine-house, etc. In

this new mill he had seventeen new looms, making fifty-nine carpet-loom in use in his business. He manufactures six-frame and five-frame Wilton and body Brussels carpets, and employs about three hundred and twenty hands.

In 1884 Mr. Hogg built a yarn-mill on part of the land he had purchased of Mr. Crompton, on the site of the first Packachoag Spinning-Mill, and has continued to run it up to the present time. This building was one hundred by sixty feet. The last mill built has seventeen looms, making in both of his mills fifty-three looms, which he runs at the present time, employing about three hundred and twenty hands.

Mr. Whittall is the largest individual manufacturer of Wilton and Brussels carpets in the United States. Mr. W. J. Hogg is the second largest.

The manufacture of thread has been conducted in Worcester for over twenty years. This is a most favorable place for this industry, because of the excellent shipping facilities, and the fact that the Worcester Bleach & Dye Works—one of the best dye-houses in the country—is located here.

Thread was first manufactured in Worcester in 1865. The business was discontinued from 1879 till 1881, since which time it has been a rapidly-growing industry. The Glasgo Thread Company, so called by reason of the fact that this company controls a spinning-mill at Glasgo, Conn., was incorporated in March, 1883, and for a time the business was conducted in Foster Street, in the building of Charles Baker. In 1885 the company removed to Beacon Street, where it is now located. The average daily production, at the present time, is four thousand dozen of two hundred yards.

The process of manufacture is most interesting, and consists in carding cotton until the fibres lie parallel to each other; the loose rolls are then taken to the drawing-machine, which consists of a series of rolls, each set revolving faster than the preceding, which reduces the strand to the required degree of fineness. The strands are repeatedly united and reduced. This process is called "doubling," and ensures a uniform, strong and perfect product.

The united threads, which are called "slivers," are then spun into a single thread on a mule. After being dyed the skeins are subjected to the operation of drying, and are then put upon spools for finishing by saturating with sizing, and then passing over rapidly revolving brushes.

Important improvements have been made in thread machinery since the introduction of its manufacture in this city; the most important is the automatic winder, with which the operator can wind from two to four times as much, and with less exertion, than he could formerly do by hand. The automatic machine is set to wind any number of yards the operator may desire.

The Glasgo Thread Company was the first to in-

*Wm Whittall*

roduce fine Sea Island thread upon pound spools. Formerly only the small spools were used, but now almost any size may be found, from two hundred to thirty thousand yards, which has led to a considerable saving to the consumer. The greater part of the thread used by the manufacturing trade is put up on large spools holding from six thousand to thirty thousand yards.

The Ruddy Thread Company, manufacturers of all grades of cotton thread—principally for the manufacturing trade, sewing-machines, corset-works and shoe manufactories, was established in 1887, and is located at 75 Central Street, under the management of Mr. Robert Ruddy.

C. H. Hutchins & Co., 2 Allen Court, established in 1876, manufacture elastic and non-elastic webs for suspenders and stocking-supporters, also spool tapes, used by cotton and woolen manufacturers to tie up their goods. The material used is cotton and rubber, the rubber being woven in process of manufacture. The looms are the Knowles fancy loom, one of which will weave twenty-five hundred yards per day.

The L. D. Thayer Manufacturing Company, in the building formerly occupied by Ethan Allen. Established in 1878, and manufactures tapes, bindings, galloons and webbings, and operates sixty-eight looms.

A. G. Hildreth, in Stevens' Block, manufactures overalls, pants, shirts, butchers' frocks, etc., employs forty-five hands, using sixteen sewing-machines. In 1887 three hundred and twenty-five thousand yards of cloth were cut up, and in 1888 five hundred thousand yards.

The Holland Hosiery Company, established in Hallowell, Me., in 1883, moved to Worcester in 1886, and manufactures seamless half hose.

The Worcester Felting Company, in Foster Street, do a large business in the manufacture of linings, upholstery, saddlery felts, petershams, rubber-boot and shoe linings and trimming felts.

George L. Brownell manufactures improved twisting machinery of his own invention for laying hard and soft twines, lines and cordage.

The Carroll Machine and Spindle Works manufacture machinery for twisting yarns.

Among the smaller manufactures connected with textile fabrics, but none the less important, may be mentioned the improved loom-reeds, manufactured by M. Place & Co., whose business was originally established by Silas Dinsmore in 1840.

William H. Brown, 81 Mechanic Street, manufactures a number of ingenious tools for the use of carders. This business was established in 1855.

In 1876, Mr. B. S. Roy, now located at 75 Beacon Street, began the manufacture of card-grinders, for grinding card-clothing, all his machines being of his own invention. Mr. Roy was formerly superintendent in a cotton-mill, and, recognizing the necessity of a better method for grinding the card-clothing, engaged in his present business. The old method

of grinding cards was by spreading emery on a board, which was rubbed back and forth over the ends of the wires, thus sharpening the teeth. This process was called by the English "strapping" or "strickling" the cards.

The next improvement was the construction of a machine, with a cylinder covered with emery, but with no traverse wheel. This method of grinding teeth made them uneven. In Mr. Roy's improvement, the traverse wheel runs with an endless chain back and forth on the cylinder over the teeth of the card with a rotary motion. These machines are sold in this country, South America, Mexico, Canada, England and Ireland.

J. H. Whittle, established in 1880, manufactures tin spindles for mules, spinning-frames, drawing-cans, filling-boxes, condenser-rolls, slasher-cylinders, drying-cans, etc., rubber-rolls for woolen-cards, and immersion-rolls of copper.

## CHAPTER CXCIV.

### WORCESTER—(Continued.)

#### MANUFACTURING AND MECHANICAL INDUSTRIES.

*Foundries—Machinists' Tools—Agricultural Implements—Wrenches.*

FOUNDRIES.—Mr. William A. Wheeler was one of the oldest iron founders in the State, having begun in 1812; he moved from Hardwick to Brookfield, and from the latter place came to Worcester in 1823 and established a blacksmith's business at the corner of Thomas and Union Streets. Among other pieces of work he made the doors of the Court-House in Worcester. This blacksmith's shop was on the site of the foundry. In 1825 Mr. Wheeler, in company with George T. Rice, H. W. Miller and A. D. Foster, under the name of William A. Wheeler & Co., made all kinds of castings, fire-proof book-cases and doors. To run a fan for his cupola-furnace, Mr. Wheeler had the first steam-engine, or one of the first ever operated in Worcester. In 1826 the business passed under the control of the Worcester & Brookfield Iron Foundry, which had furnaces in both places.

Daniel Heywood & Co. furnished at this time all kinds of castings. The demand appears to have been considerable, for in 1827 Washburn & Goddard received orders for machine castings made at Stafford, Conn.

In 1828 Sumner Smith (Worcester Iron Foundry) put a furnace in blast near the paper-mill of Elijah Burbank, at Quinsigamond, and had for sale every description of iron castings, cast-iron plows, stoves, cauldron kettles, hollow-ware, oven frames, Darby's patent wheel-boxes. In 1833 the Worcester Iron Foundry removed from Quinsigamond to the first mill privilege north of Main Street, one mile from

the Court-House, on the Worcester road leading to West Boylston.

In 1831 or 1832 Mr. Wheeler returned to Worcester and reorganized his shop, abandoned the steam-engine which he had previously put in, and substituted horse-power, and continued to do a constantly increasing business until the foundry was enlarged, about 1840, when another steam-engine was added and a machine-shop attached. The castings were made for the iron-workers and tool-makers in the city, and comprised castings for heavy gearing, besides a variety of other work, including heavy sheet-iron work, fire-proof safes, mill-irons, water-wheel irons, cages, coupling-boxes, plow-castings, patent ovens, ash-holes, boiler-doors and pipe-boxes; factory shafting was also turned.

About the time his machine-shop was started Mr. Wheeler procured an iron planer, to be run by hand. This was the first iron planer in Worcester, or in the State. It would weigh about one hundred and fifty pounds, and was three-and one-half feet high. The bed was four feet long and twenty inches wide.

Mr. Wheeler designed the first boring-machine in Worcester, and in 1838 got out patterns for cook-stoves, box-stoves for heating, and manufactured them, and in 1842 invented a furnace for heating buildings with wood or coal.

In 1838 he started the manufacture of brass castings for general use.

When Mr. Wheeler commenced business he made five hundred or six hundred pounds of castings per day, and increased until his daily production was ten tons. He began with three or four men, and in the height of his prosperity employed two hundred.

In 1852 Mr. Wheeler's son (Charles) became interested in the business at Thomas Street, and when William A. Wheeler died, in 1873, it passed into the hands of William F. Wheeler, and finally to the Wheeler Foundry Company, which remained at the old location for a time, and then moved to 138 Mechanic Street, where the business has been located for seventeen years, employing about ninety men, largely in making castings for wire and rolling-mill machinery and for general purposes.

In 1843 the Washington Square Iron and Brass Foundry, built by A. A. Trask, was operated by S. Trask & Co. in the manufacture of cauldron-kettles, stoves, oven-doors, ash-pits, etc., and in 1843 a new foundry was built near the Boston and Worcester Railroad by Henry P. Howe, and was occupied by George Goodnow in the manufacture of iron, copper, brass and composition castings.

In 1847 Oliver K. Earle built a foundry on the corner of Canal and Foundry Streets. He sold out to A. B. Chaffee in 1848, who took Jason Chapin into company the same year. They started in business to supply Howe & Goddard with their brass castings. In 1852 Chapin purchased Chaffee's interest, and in 1853 built a shop in Manchester Street, where he con-

tinued until 1859, when he built the shop in Summer Street, where he continued until 1887, when he sold out to Mr. L. H. Wells.

In 1849 Fitch & Jones made castings in iron and brass, and were succeeded in 1850 by E. & D. H. Fitch & Co.

In August, 1850, McFarland & Bisco, of Leicester, started in the malleable iron business, which was continued in 1851 by Wood, McFarland & Co. They occupied the building known as the Arcade, formerly known as "The Old Brewery," near the Western depot. Here, with one air furnace and two small annealing furnaces, they commenced the making of malleable castings for guns, carriages, harness buckles, wrenches and parts of cotton and woolen machinery, previously made of wrought iron. At this time there was but one other malleable iron foundry in the State, which was located at Easton. The process of malleable iron founding is different from that of ordinary casting. The purpose to which the product is applied requires a greater degree of tensile strength and tenacity in the materials and a closer attention to all the details. Instead of placing the coal and pig-iron in the furnace together, the pig-iron is thrown into what is called the air furnace by itself and subjected to an intense heat; it is then drawn out and poured into moulds, in which state the metal is very hard and brittle; it is then packed in an annealing furnace and subjected to strong heat for about nine days and nights, when the furnaces are opened and the pots cooled; the iron is then unpacked and cleaned ready for delivery, when it has both fineness of grain and great toughness.

The old firm of Wood, McFarland & Co. remained in business but a short time; their interest was taken by Warren McFarland, who continued with a silent partner until 1877, when he became the sole owner.

From one air furnace and two annealing furnaces the plant was increased until it had two air furnaces and six annealing furnaces.

In 1880 Mr. George B. Buckingham, who had been connected with Mr. McFarland since 1873, took charge of the works, Mr. McFarland remaining connected with it till his death, in 1884.

In December, 1886, Mr. Buckingham purchased the property of the Worcester Malleable Iron Foundry, that being the second known by this name, which had been run about three years, and has since been run as the Worcester Malleable Iron Works, giving the two plants, now under one management, a capacity of three air furnaces and nine annealing furnaces.

The line of goods now made includes different parts of agricultural implements, guns, pistols, sewing-machines, cotton and woolen machinery, in fact, all parts of machines or tools where strength and lightness are combined. The use of malleable iron and steel castings, which are now made by the above

W. Lloyd

*Wm. Post Hogg*

works, is largely owing to the reasonable price in comparison with forgings, as odd shapes can be more easily produced than by the forge.

The second malleable iron foundry, known as the Worcester Malleable Iron Foundry, was started in Manchester Street, by Waite, Chadsey & Co., in 1852.

In 1857 Oliver K. Earle, who had previously been in the lumber business, was admitted into partnership with Fitch & Jones, who continued business at the Union Street Foundry (present site of Rice, Barton & Fales) and also at the Junction Foundry in Southbridge Street. After Mr. Earle's death, Willard Jones, Wood & Light, Richardson, Merriam & Co. succeeded; it was then taken by Mr. Otis Warren, the present proprietor, who has controlled it for the last fourteen years. The first work done at this foundry was the manufacture of the iron-work for the front of Foster's Block, at the corner of Main and Pearl Streets.

Caleb & J. A. Colvin commenced the foundry business at Danielsonville, Conn., in 1863, where they manufactured stoves and machinery castings. In 1865 Caleb sold his interest to his brother and moved to Worcester, where he bought and built his plant in Gold Street.

The business increasing, J. A. Colvin moved to Worcester, and a new partnership was formed, which continued until 1880, when J. A. Colvin built his present foundry in Jackson Street. His principal work is for the loom companies, and largely for the Knowles Loom Works. He employs about ninety hands.

Since 1880 Mr. Caleb Colvin has more than doubled his capacity for doing work. He employs ninety hands, and has a capacity of three hundred tons per month, almost entirely used in the city, and largely by the makers of woolen machinery, machinists' tools and wood-working machinery.

Heald & Brittan built on Foundry Street about 1866, and made iron castings. They removed from there to Thomas Street Foundry, when the Wheeler Foundry Company moved to Mechanic Street. This foundry afterwards came into the possession of the Holyoke Machine Company.

L. H. Wells and Herbert M. Rice began business January 1, 1867, in North Foster Street. Mr. Wells learned his trade of Jason Chapin, and was subsequently foreman of the late George Crompton's foundry, in Green Street. Mr. Wells purchased Mr. Rice's interest in September, 1869, and in 1877 invented his bronze metal, largely and successfully used for bearings. By the use of chemicals the oxidation of the tin, one of the ingredients, is prevented; the metal is ten per cent. denser than the ordinary bronze, and of a very firm, tough structure. In 1887 Mr. Wells purchased the Chapin Foundry in Summer Street, to which he has removed. Mr. Wells has the largest set of furnaces in the city; his castings

are cleaned by power in a large water rumble, a hollow cylinder, which makes ninety revolutions per minute, and emery wheels are used for smoothing the castings.

The process of casting is simple, and consists of melting the metal in crucibles, which are made of plumbago, and then turning the molten metal into moulds. When taken out they are cleaned and finished.

Prespey Pero, located in Hermon Street, manufactures machinery and tool castings, and makes a specialty of light castings; was established in 1877. His business has grown from employing three or four men until he now employs forty-five.

The Star Foundry was established in 1880 by George Crompton, and started with forty men. Double that number are now employed on all kinds of work, including steam-engines, machinists' tools and castings for building purposes, although the principal product is loom castings for the Crompton Loom Works.

Luther Shaw & Son do a business in brass casting, and manufacture Babbitt metal and solder, also all kinds of brass composition, zinc, lead and white metal castings. They also make gong-bells, faucets and copper castings. Their product is sold throughout New England, and some of it in New York State, but the bulk of it is used in this city and county. The metals used are principally copper, tin and antimony.

Arnold & Pierce, at the Hammond Street Foundry, established in 1882, began with six men, and now employ twenty-two. They manufacture castings for the makers of machinists' tools.

The firm of A. Kabley & Co., composed of A. Kabley, Alonzo Whitcomb and F. E. Reed, located at 57 Gold Street, started with fifteen men, and now employ forty. They supply all the castings for the machinists' tools of F. E. Reed and Alonzo Whitcomb & Co., besides some general work.

**MACHINISTS' TOOLS.**—The manufacture of machinists' tools has, for many years, had a most prominent place among the industries of Worcester. To Samuel Flagg, or, as he was more familiarly known, "Uncle Sammy Flagg," belongs the distinction of having first engaged in this business in Worcester, whither he came, from West Boylston, in 1839, to secure better facilities and to save cartage of castings which he used in his machine-shop in West Boylston, where he built tools and cotton machinery from patterns made by William A. Wheeler. He made a turning-lathe, which was the first one Mr. Wheeler had when he started his machine-shop. The ways and frame of his machine were of wood, the head and tail-box of iron.

Mr. Flagg hired room and power of Samuel Davis, the lessee of Court Mills, and there made hand and engine lathes. He had no planer when he commenced, and at this time the planing of iron was

looked upon as a remarkable accomplishment. The work was done by hand-chipping and filing, which was of necessity tedious and unsatisfactory.

The old Court Mills, located on Mill Brook, at the junction of Lincoln Square and what is now Union Street, was the cradle of the machinists' tools industry in Worcester, as it was of many others.

Mr. Flagg started with eight or ten men, and every one thought that he was visionary to expect to keep them occupied in building machinists' tools. He was the first man in Worcester to use a planer in this business. He commenced in Court Mills. Ruggles, Nourse & Mason, and Thomas Daniels, the inventor of the Daniels planer, were also tenants. Deacon Richard Ball was at this time Mr. Daniels' foreman.

In 1845 Thomson, Skinner & Co. succeeded to Mr. Flagg's business. They moved to Merrifield's building, and, shortly before the fire of 1854, were absorbed by the New Haven Manufacturing Company, and removed from the city. Mr. Flagg continued without a competitor until Pierson Cowie started in the old Red Mill, the present location of the Crompton Loom Works. From there he removed to the then new building of Howe & Goddard, now Rice, Barton & Fales, in Foster Street, and thence into the building where W. T. Merrifield's engine is now located.

In 1845 or 1846, Cowie made six iron-planing machines which were driven with a common log chain passing over a drum at each end of the machine. This arrangement was, in a few years, superseded by a rack and gears.

He was succeeded in 1845 or 1846 by Woodburn, Light & Co., who, in 1851, moved to Estabrook's new building at the Junction, built by Charles Wood and Col. James Estabrook. Later the firm became Wood, Light & Co., and, in 1870, built the shop now occupied by McIver Brothers, where they at one time did a very flourishing business, and had the best equipped shop in New England, employing one hundred and seventy-five men. They introduced greatly improved methods for turning shafting, increasing the amount from forty or fifty feet per day to three hundred feet. They also invented and manufactured bolt-cutting machines, the best then known.

The building of railroads created an increased demand for machinists' tools, and in 1845, Samuel C. Coombs, a machinist in the employ of Phelps & Bickford, in company with R. R. Shepard and Martin Lathe, a wood-worker, in the same shop, formed a co-partnership under the style of S. C. Coombs & Co. They started in the Court Mills, then moved to Dr. Heywood's shop. Before they moved C. Wheelock was taken into partnership. From the Heywood shop, in Central Street, now used by the Harrington Brothers as a paint shop, they removed to the Estabrook shop, where they occupied room in the northern end of the building, where their successors, the Lathe & Morse Tool Co., continued until they moved to their own building, in Gold Street, where they are now

located. Their business from the start has been the manufacture of lathes and planers. They employ on an average about fifty hands, and their product goes all over the world.

The first exhibit of machinists' tools was made by S. C. Coombs & Co., at the Mechanics' Exhibition held in September, 1851. The first exhibition of the Mechanics' Association was held in the City Hall, Tuesday, September 26, 1848, and the circular announcing it was signed by William B. Fox, William A. Wheeler, Ichabod Washburn, William N. Bickford, Freeman Upham, John Boyden and Samuel Davis.

A. & S. Thayer began at Court Mills in 1845, where they employed ten men in the manufacture of engine lathes. These were an improvement upon the lathes then in use, and attracted much attention among machinists.

A. & S. Thayer moved from Court Mills into Allen & Thurber's Pistol Shop, which stood just south of Merrifield's present engine-house, and was burned in 1854.

They occupied the south-end basement, while Samuel Flagg & Co. occupied the north end. They afterwards moved into the Dr. Heywood building, in Central Street. While there, Sewall Thayer died. Upon his death, A. Thayer associated with him H. H. Houghton and E. C. Cleveland. They moved back into the pistol-shop, and remained in Union Street till the fire, when they removed to Washington Street (present location of the Allen Boiler Works), and continued in business until 1857, when Mr. Cleveland retired. They continued the business at the Washington Street shop until the breaking out of the war, or a little later, and were employing about one hundred and fifty men, and making some of the finest tools in the country, when the business was bought by the New York Steam-Engine Company, and continued a short time under that name, when it was moved to Passaic, N. J., and finally went out of existence.

The firm of Samuel Flagg & Co. was organized in 1847. Mr. Flagg associated with him Henry Holland and two of his former apprentices,—L. W. Pond and Ephraim H. Bellows. They started in the second floor of Heywood's building, in a room twenty feet by forty. They remained there but a short time, until Allen & Thurber's building was ready for tenants, when they moved into the north end; they remained there until 1849, when Mr. William T. Merrifield put up his first brick building; they then moved into the same location now occupied by the Wheelock Steam-Engine Company. Shortly before the fire they took the whole basement, and were burned out in 1854, when they went into the lower floor of the Goddard & Rice factory in Union Street, where they remained until the Merrifield buildings were rebuilt, to which they returned, remaining until 1861.

Prior to this time Mr. Pond had bought out the

*J. A. Colvin*

others in interest. Meantime J. B. Lawrence, in 1854, built the east end of the building lately occupied by the Pond Machine Tool Company. In 1861 L. W. Pond purchased this, and built the west end, and continued there until 1875, when the business was continued by the Pond Machine Tool Company, which in 1888 removed to Plainfield, N. J. While in Worcester, they maintained a high reputation for the quality of their work, excelling particularly in the production of large tools.

The brothers, Carter Whitcomb (who had been in the employ of Howe & Goddard) and Alonzo Whitcomb (who had been in the employ of S. C. Coombs & Co.) formed a copartnership under the name of Carter Whitcomb & Co., and began the manufacture of copying-presses, in 1849, in the Union Street shop of Howe & Goddard. They occupied room in Merrifield's shop prior to the fire of 1854, when they were burned out; they returned soon after the new building was completed, and later went to the Estabrook building, and from there to the present location in Gold Street.

This was the first successful attempt to establish in this country the business of manufacturing copying-presses. George C. Taft had previously begun the manufacture, but continued only a short time, when it fell into the hands of the Messrs. Whitcomb. These presses have been sold throughout the country, the sales, some years, amounting to five thousand presses. From the first this company has manufactured iron planers, and later commenced the manufacture of shears and punching-machines. The iron planers first made very light and poorly constructed; the gears were cast, the cut-gear was unheard of. This company continues to make copying-presses, iron planers and shears for cutting iron plate for boilers, but their principal business is in planers.

In 1856 Samuel Flagg organized a Machinist Tool Company, composed of Samuel Flagg, Pierson Cowie, Dexter Flagg, Lemuel G. Mason and George H. Blanchard. They only continued in business a short time, but made at their shop, in Merrifield's building, the largest lathe, with one exception, up to that time made in the country. It weighed about thirty-five tons; the length of the ways was thirty-five feet and width eight feet. They also engaged in the manufacture of machines for mortising iron, weighing six tons each, some of which were made for the government.

In the fall of 1864 Joseph A. Sawyer had a little shop in the building known as Heywood's Boot Shop, in Main Street, for repair work and the manufacture of sewing and other machines; subsequently he removed to the second floor of the Union Water Meter Shop in Hermon Street, where he manufactured shafting, pulleys and friction pulleys. In the fall of 1877 he built his present shop, one-story, forty by seventy-two feet, and in 1881 he built two additional stories, to furnish room and power to let. Mr.

Joseph A. Sawyer was the inventor of a machine for pleating cloth up to eighteen inches in width, which was sold to the Elm City Company, of New Haven, and is said to be the only practical pleating-machine ever invented. Mr. Sawyer invented many devices now used in boot and shoe factories. Since his death, in May, 1888, the business has been continued by his son, who manufactures Sawyer's Combined Hand and Power Planer, and who also does a large business in fitting up corset and boot and shoe shops, putting up the stitching-machines and keeping them in repair. Mr. Sawyer has made much automatic machinery used in the organ and reed business, and makes a specialty of difficult machines for special purposes. Their work is of a varied character, and much of it very delicate.

Parritt Blaisdell, who was with Wood, Light & Co. for fifteen years, built a shop in Jackson Street in 1865 and commenced the manufacture of machinists' tools, with four or five men. Afterwards he took into company John P. Jones, and in 1873 S. E. Hildreth. Mr. Blaisdell died in 1874. His widow sold a part of his interest to Enoch Earle, and all of these partners are in the business at the present time. They have enlarged their shop and increased their business until at the present time they employ about one hundred men.

W. F. Bancroft & Co., established in 1870 by Kent & Bancroft, make self-operating spinning machinery, lathes, planers and special machinery.

William H. Eddy, manufacturer of machinists' tools, established 1873, manufactures planers, twist-drills, grinding-machines, stone, bolt and gear cutters; the twist drill-grinders are his own invention; he has also devised a clutch friction pulley that prevents noise in the changing of belts. He began with two men, but now employs eighteen. Mr. Eddy was contractor for L. W. Pond for twenty-one years.

F. E. Reed, in April, 1875, purchased a half-interest in the concern of A. F. Prentice, who then employed six men in French's building, in Hermon Street. In August, 1877, Mr. Reed purchased Mr. Prentice's interest and continued the business alone. At first he occupied but one floor, but soon added another, and later, built a commodious shop in Gold Street, which was finished in 1883, two stories and a basement, one hundred and eighty by fifty-five feet. The machinery and tools are all new and of the best patterns. One hundred and twenty-five men find employment in this business, and the power is furnished by a forty horse-power Brown engine, while an Armington & Sims engine drives an Edison dynamo which supplies three hundred sixteen candle-power lamps. The principal products of this shop are engine-lathes, ten to twenty inch swing, hand-lathes from nine to sixteen inch swing and a large line of foot-power lathes, with or without screw-cutting attachments. These machines are shipped to England, Germany, Japan, Mexico and to other

countries, and large quantities to all parts of the United States.

Under the names of Boynton & Plummer, 50 Lagrange Street, James Kindred, H. S. Brown and Henry Kindred have, since 1878, manufactured blacksmith drills, bolt-cutting machines and shaping-machines, and are the pioneers in this class of work in the city. Their trade extends throughout the country and to Australia and South America.

In February, 1878, E. H. Wood began to manufacture for Harwood & Quincy, of Boston, the Bramwell Feeder, which is used for feeding the wool into carding-machines. This feeder has revolutionized the work of supplying carding-machines, and has been a great factor in the development of the wool-carding business.

In 1881 their present shop, near the Junction, was completed and the Harwood & Quincy Machine Company was formed. The Bramwell Feeder was invented by W. C. Bramwell, of Terre Haute, Ind.; the entire patent is owned by Harwood & Quincy, who have the exclusive manufacture of the machine. Mr. Edwin H. Wood, the superintendent of this company, was seventeen years the foreman in the shop of Daniel Tainter, formerly a well-known manufacturer of woolen machinery.

In 1879 Mr. W. C. Young, began with one assistant in Mawhinney's building, No. 19 Church Street, the manufacture of shoe tools and edge planes; he now employs twenty hands in the manufacture of engine-lathes, wood-turning and amateur lathes, which he designs himself, exporting a large number.

J. A. Fuller, at No. 3 Cypress Street, makes machinists' tools, lathes, planers and speed-lathes, employing seven men; he also manufactures bench-gears and small dynamos.

Currier & Snyder began in 1883 in Central, and are now at 17 Hermon Street, where they manufacture upright drills. At first they employed but one hand, and now they employ fifteen. The ease and rapidity with which their drills can be manipulated have won for them a high reputation. Both the partners were for many years employed in the Blaisdell shop.

The Powell Planer Company was incorporated in 1887 for the manufacture of machinists' tools, and make a specialty of iron planers. They control patents upon lathe devices, for shifting belts, and for general convenience in operating the machine; and have a system for securing a very fine, even surface for the working parts of their machines by using what they call "surface plates." Starting with three men, they now give employment to fifty.

The tools made previous to 1845 were very much lighter than those made to-day. The beds of the engine lathes were of wood, with strips of iron bolted to them for the ways, and the carriage that held the cutting tool was operated by a chain. Gradually this was superseded by a rack and gears driven by a rod in front of the lathe. Tools have been very

much increased in weight and the workmanship is much improved. There has been as great a change in the character of our shops in the last forty years as in their products. Then, a man was expected to begin work as soon as he could see, and to continue until nine o'clock at night, with half an hour for breakfast, an hour for dinner and half an hour for supper. Whale-oil lamps were used; there smoked badly, and made the atmosphere almost unendurable. Pay came but once in six months, and then often in the form of a note,—a strong contrast with the short hours of the present day, steam heat, gas or the electric light and weekly wages in cash.

AGRICULTURAL IMPLEMENTS.—It is said that it took the observation of the farmers and the inventive genius of the mechanics of the country, from 1797 to 1842, to decide upon the best form of a plow. It was a subject that seemed to afford endless opportunity for argument and controversy. Thomas Jefferson was much interested in the subject, and in a letter written to Jonathan Williams, in July, 1796, says that he has discovered "the form of a mould-board of least resistance," that he has reduced it to practice, and that his theory is fully confirmed. He gave this subject careful study, as appears from his correspondence.

The first iron plow in Worcester County was made by William A. Wheeler, in Hardwick, in 1822, but plows of some sort were made in Worcester in 1821 and prior to that time by Oliver Wetherbee, who carried on the business in the blacksmith's shop of Levi Howe, and later at his own shop, a few rods from Captain Thomas' inn.

In November, 1823, Mr. Wheeler announces that he will keep on hand all kinds of plows at his shop in Thomas Street.

In November, 1824, the committee, in reporting upon the articles exhibited at the Cattle Show, then lately held, refer to two cast-iron plows exhibited by Oliver Wetherbee, and state that those plows are fast superseding those of the old construction.

Burt & Merrick, in June, 1828, appear as agents of the Hitchcock plow, claimed to be superior to those previously used, and in 1829 Benjamin Butman & Co. had for sale "Nourse's Cast-Iron Plows." These plows were manufactured by J. & J. Nourse, at Shrewsbury, and were known as the Hartford Cast-Iron Plows.

In April, 1833, C. Howard's cast-iron plows are offered for sale by G. T. Rice & Co., and, at the same time, Mr. Wheeler announces that he has "just received an assortment of plow-points from the various patterns heretofore cast at Brookfield." Meantime, Mr. Joel Nourse appears to have moved from Shrewsbury to Worcester, and to have taken a shop in Thomas Street, for in August, 1833, he there offers for sale plows of the most approved construction and of five different sizes. He also offers for sale in March, 1834, his "side-hill plows." Mr. Nourse seems to

have been a successful manufacturer of plows, for in its report, the committee at the Cattle Show, in 1835, compliment him highly, and say that all the plows on the field except three were of his make.

J. Nourse & Co., March, 1836, added the manufacture of cultivators to their business, and in March, 1838, Ruggles, Nourse & Mason, a firm composed of Draper Ruggles, Joel Nourse and J. C. Mason, announce that they have made arrangements for manufacturing on an extensive scale the most improved form of cast-iron plows, and that they have secured Jethro Wood's patent on the same, and add,—“Most of the cast-iron plows are made too short, and are too concave for the mould-board to run easily.” Ruggles, Nourse & Mason make plows for turning over green sward, turning over stubble; and also make three sizes of the celebrated side-hill plows; also, improved seed-sowers, improved expanded cultivators, and Coats' patent revolving hay-rake.

The first plow made by Nourse and others was a clumsy affair; the mould-board and standard were of iron, the rest of wood.

Ruggles, Nourse & Mason were in Thomas Street, at first, about opposite the present location of the City Water-works Shop; afterwards Mr. Samuel Davis induced them to move to Court Mills, where increased facilities enabled them to largely extend their business.

The next new implement made by Ruggles, Nourse & Mason was the Wilkes revolving horse-rake. They were constant exhibitors at the Cattle Shows, and in 1851 showed over twenty different kinds of plows. This industry was a most important one. Worcester, at that time, is said to have been more largely engaged in the manufacture of agricultural implements than any other city or town in the United States, and the business had been entirely developed within a comparatively few years; for there were those living who remembered the stub hoes and wooden plows, while the sensation of first seeing the cast-iron plow was fresh in the recollection of many farmers in the county. Ruggles, Nourse & Mason at this time, 1851, occupied the Court Mills, the main building being of brick, two hundred and fifty feet long, seventy-five feet wide and four stories high, and employing about two hundred hands. The motive-power was partly steam and partly water, supplied by Mill Brook. The same turbine wheel is still used for power in E. W. Vaill's chair factory.

The white oak timber used was furnished by Oakham, Paxton, Sterling and other towns. The iron castings were made in an adjoining building, and three tons of iron were used daily. The product was sold in Boston, where the sales-room occupied the second story in Quincy Market, and where were displayed upwards of three hundred different patterns of plows alone, to say nothing of other agricultural implements and dairy equipment.

Among the recipients of medals at the Crystal Pal-

ace Exhibition in New York, in 1854, was the Worcester Shovel Company, for Kimball's patent shovels with malleable iron sockets; and Ruggles, Nourse & Mason for Armsby's patent corn shovel, for Perry's patent meat-cutter and a vegetable-cutter; also, for double sod and subsoil plow. In 1855 they offer mowing-machines for sale.

April 1, 1856, Ruggles, Nourse & Mason were succeeded by Nourse, Mason & Company, consisting of Joel Nourse, Peter Harvey and Samuel Davis.

After a time Nourse, Mason & Company sold out to Mr. Nourse, who organized a company consisting of Joel Nourse, Peter Harvey and Sampson & Tappan, of Boston, doing business under the name of Nourse, Mason & Company. Meantime, they had started a shop at Groton Junction, where they were increasing their capacity as well as employing all the labor that could be accommodated at the Worcester factory. In 1859 they were employing two hundred and fifty hands; their pay-roll amounted to eight thousand or nine thousand dollars per month, and they had increased their power by putting in a sixty horse-power engine.

In 1860 the works were purchased by Oliver Ames & Sons, and, in 1874, moved to the large brick factory in Prescott Street, where they are now in operation, under the name of the “Ames Plow Co.” They manufacture all kinds of agricultural implements, power-machines, meat-cutters, etc. In 1887 they made seven thousand wheelbarrows. They make seven thousand plows yearly, and employ one hundred and seventy men.

In 1857, J. T. Adriance & Co., manufactured Manny's improved mowing-machine, and during that year made about six hundred of them. Alzirus Brown, in 1858, also manufactured these machines and Manny's reaper, employing about forty to fifty hands.

In September, 1859, J. M. C. Armsby, who had previously been a partner in Nourse, Mason & Co., completed his building in Central Street, for the manufacture of plows, cultivators, harrows, horse-rakes, hoes, etc. It was one hundred feet long, thirty-five feet wide and four stories high, with two wings extending back—one seventy-four and the other fifty feet. An engine of twenty-five horse-power, made by the Putnam Machine Company, was the only piece of machinery in the building not of Worcester manufacture.

A patent was granted, December, 1861, to L. G. Kniffen, of Worcester, on his Union Mower. He formed a company for its manufacture, to be known as the “Union Mowing-Machine Company,” Alzirus Brown, agent.

**THE WRENCH BUSINESS.**—The water privilege at New Worcester, occupied by the two factories of the Coes Wrench Company, are, historically, of considerable interest.

Captain Daniel Gookin, who was one of the com-

missioners appointed by the General Court, October 11, 1665, to survey the country in the vicinity of Lake Quinsigamond, to determine if there be a "meet place for a plantation, that it may be improved for that end, and not spoiled by granting of farms," was the original owner of this property, and from him Mr. Loring Coes' great-grandfather had a deed of this water-power and built a saw-mill at the upper dam, where previously there was a beaver dam.

On the site of the Leicester Street mill, wool and carding machinery was built from an early day. This privilege came into the hands of Moses Clements, and from him passed to William Stowell, who also made woolen machinery, carding machinery and jacks. From Stowell the privilege passed to Thomas Harbach, at one time associated with Joseph Converse, then to Edward and Martin Wilder, from whom it was purchased by L. & A. G. Coes, in 1848. At the southwest end of the Leicester Street Works was the old Clements building, of wood, two stories high and fifty or sixty feet long. It was later taken down by the Coes'. The building at the northeast end, still standing, was erected by William Stowell, about 1835, and was at one time occupied by Kimball & Fuller, in the manufacture of woolen machinery. Loring and A. G. Coes were both born in New Worcester, and both worked for Kimball & Fuller. In 1836 the brothers formed a copartnership and purchased this business, which, meantime, in November, 1835, had been moved from New Worcester to Court Mills. Here they continued until October, 1839, when the Court Mills were destroyed by fire. This loss so far impaired their capital as to prevent their starting again. Their fellow-tenants also burned out were, Samuel Davis, builder of woolen machinery; Ruggles, Nourse & Mason, manufacturers of plows and agricultural implements; H. W. Miller, punching-machines for manufacturing nuts, washers, etc., and Thomas E. Daniels, builder of planing-machines.

After the fire the brothers went to Springfield, Mass., and engaged as pattern-makers in the foundry of Laurin Trask;<sup>1</sup> while there employed they made a model of a new and improved form of the wrench, a tool which they constantly used. There were at that time two styles—one of English invention, and the other known as the Merrick or Springfield wrench. The mechanism of both these wrenches was such that both hands were used to open or close them. This was often inconvenient, as it was important to so adjust the wrench to different openings, by the hand in which it was held, as to leave the other hand free for other demands of the work. It occurred to the Coes Brothers to dispense with the screw on the shaft, as in the Merrick wrench, and affix by the side of the shaft, a small bar in the form of a screw, which should enter another screw formed in the lower or movable jaw of the wrench; and that the first screw

should also have, at its lower end, where it should enter the handle, a rosette always in reach of the thumb of the hand that held the wrench.

This rosette, being pressed and turned by the thumb would operate the screw, and the opening and closing of the wrench would easily be effected by one hand. It seemed to them that this adjustment would make the tool much stronger by removing the indentations from the bar or shaft, and that there would be less liability of injury to the wrench from severe or improper use.

In November, 1840, they returned to Worcester, and at once directed their efforts to securing a patent for their invention. The patterns of their spinning machinery had been saved from the fire, and these they sold to Samuel Davis, a manufacturer of woolen machinery, and so obtained the means for securing a patent, which was granted to Loring Coes, April 16, 1841.

The brothers now formed a co-partnership under the name of L. & A. G. Coes, for the manufacture of wrenches under this patent. They were without capital, and Henry W. Miller, a hardware dealer in Worcester, aided them by fitting up a shop (in the northwest end of Court Mill, in Mr. Miller's shop), with the requisite machinery and tools, of which he retained the ownership, taking and selling all the wrenches manufactured by the Messrs. Coes. The business was so far successful that early in 1843 they were able to purchase the machinery and tools. They were now employing three hands, and made a contract with C. Foster & Co. to sell their goods. The next winter (1843-44) they moved to the shop of Albert Curtis, in New Worcester. They leased a basement in one of Mr. Curtis' buildings who built them a blacksmith shop, and put in a trip-hammer for their use.

At the close of their contract with C. Foster & Co., April 1, 1848, they entered into a contract for five years with Ruggles, Nourse & Mason. At this time, also, they bought for fifty-five hundred dollars the old woolen-mill in which they had both worked in their youth—the water privilege, two houses and about four acres of land. They were now employing from twelve to fifteen men, and making from five to six hundred wrenches a month. They repaired and raised the mill and put in a new water-wheel and new machinery.

"Their contract with Ruggles, Nourse & Mason expired, by limitation, April 1, 1853, and they thenceforward sold their own goods. They had, during the twelve years since their first patent was granted, devised, individually or jointly, various improvements in the wrenches and in the special machinery used in their manufacture.

"On July 21, 1853, with Levi Hardy, they purchased from Moses Clement his shop, machinery and business—that of the manufacture of shear-blades and knives for hay-cutting machines. The co-partnership continued until May 2, 1864.

<sup>1</sup> Van Slyck, "New England Manufacturers and Manufactories."

*Levin Coey*

"After the dissolution of their co-partnership, having purchased Mr. Hardy's interest in it, they continued the business, with Charles A. Hardy as the superintendent of the shop, keeping its accounts distinct from those of the wrench business.

"In 1865 they built a dam half a mile above their water privilege, to form a reservoir, and the next year they built a shop at the reservoir, one hundred feet by forty, two stories high, with a basement, devoting it exclusively to the manufacture of shear-blades, hay-cutter knives and similar articles.

"In 1867 they built a new dam one hundred rods below the reservoir."

On April 1, 1869, they dissolved their co-partnership and divided the business—Loring Coes taking the upper privilege, including the shear-blade business, and A. G. taking the lower privilege, and paying a bonus for the right of choice. At this time they sold monthly from ten to twelve thousand wrenches.<sup>1</sup>

L. Coes & Company erected the large brick factory at the lower dam, one hundred feet long, fifty feet wide and four stories high, with basement and attic. The building, with the machinery to be used in it, was finished early in 1871.

The Coes Wrench Company is a consolidation of the two companies, which was effected April 1, 1888, with Loring Coes, president; John H. Coes, treasurer, and Frederick L. Coes, secretary—the two latter, sons of A. G. Coes. They are now manufacturing wrenches under patents of Loring Coes, dated July 6, 1880, and July 8, 1884; are producing fifteen hundred wrenches per day and employ one hundred hands.

At the outlet of the upper pond Mr. Loring Coes carries on quite an extensive business in the manufacture of die stock for cutting sole-leather and other purposes. He also makes shear-blades, knives for meat, cheese-cutters and lawn-mower knives. He has a trip-hammer in this shop, and the old rolling-mill, used for making plane irons, by William Hovey, on the mill dam in Boston many years ago.

L. Hardy & Co., at New Worcester, conducted by Henry A. Hoyt, manufacture shear-blades, die stock for cutters, &c., and John Jacques, at New Worcester, manufactures patent shears for book-makers, binders, printers and paper-box makers; also shears for tin-plate workers.

Other manufacturers of wrenches, in a small way, have engaged in the business from time to time. In April, 1852, E. F. Dixie advertises to manufacture "Hewet's celebrated screw-wrench." George C. Taft and John Gleason manufactured wrenches, in connection with copying-presses, at Northville, in 1853. B. F. Joslyn, who seems to have been a most ingenious mechanic, and who made several inventions in fire-arms, made several improvements in wrenches, and on one of these, at least, procured a patent.

Ruggles, Nourse & Mason, who were at one time selling agents for the Coes', manufactured wrenches in 1859, in connection with the business in agricultural implements.

## CHAPTER CXCIV.

### WORCESTER—(Continued.)

#### MANUFACTURING AND MECHANICAL INDUSTRIES.

##### Wire—Wire-Workers—Coppers.

**WIRE.**—In the latter half of the eighteenth century the desirability of commencing the manufacture of wire in this country was very generally recognized. But little progress was made for some years, and most, if not all, of the card-wire was imported from England. In fact, at this time there was very little wire made in the world. From a well-authenticated source the assertion is made that in 1810 the entire output of wire in England would not exceed one four-horse load weekly.

From the report of Albert Gallatin, then Secretary of the Treasury, made in 1810, it appears that the demand for cards was twice as much in 1809 as in 1808, and was increasing.

The wire is imported, and serious inconvenience would attend the stoppage of the supply, although the manufacture might, and would be immediately established to supply all demands, if the same duty were laid on wire, now free, as on other articles of the same material.

In the early days the hardware dealers of Worcester imported their wire from England or Germany. Wire was drawn in Walpole, soon after the Revolution, by Eleazar Smith, and card-wire was drawn by hand in Leicester as early as 1809. In 1813 mention is made of a wire factory, run by Joseph White, in West Boylston; in April, 1814, of its manufacture in Phillipston, and in the same year a wire factory is advertised for sale at Barre, on the Ware River.

Prior to 1815 a building on the present site of the Coes Wrench Factory, Leicester Street, New Worcester, was occupied as a wire factory.

Wire was drawn in Spencer between 1815 and 1820. Its manufacture in Worcester was begun in 1831 by Ichabod Washburn and Benjamin Goddard, in a wooden factory at Northville. This was on the second privilege south of North Pond dam, and was built by Frederick W. Paine. The factory now standing on this site is the third one built there, the two preceding having been burned.

Ichabod Washburn first engaged in business in Worcester in 1820, with William H. Howard, in the manufacture of woolen machinery and lead pipe. Mr. Howard shortly afterwards left town, and Mr. Washburn purchased his half of the business, which he continued.

The demand for woolen machinery increasing, Mr. Washburn, in 1822, took as partner Mr. Benjamin

<sup>1</sup>Van Slyck, "New England Manufacturers and Manufactories."

Goddard, the firm being Washburn & Goddard, and they soon employed thirty men. They made the first condenser and long-roll spinning-jack ever made in Worcester County, and among the first in the country.

Any one passing in Main Street, by the head of School Street, in the year 1822, might have seen projecting from one of the large sycamore trees standing there, the following sign:—WOOL CARDING AND LEAD AQUEDUCT MANUFACTORY, with a hand pointing down the street to Washburn & Goddard's shop, on the site now occupied by N. A. Lombard's building, and near the site of the factory for the manufacture of corduroys and fustians, occupied in 1789 by Samuel Brazier.

During the winter of 1830-31 Mr. Washburn, in a small wooden building, back of what is now the brick part of N. A. Lombard's factory, in School Street, experimented in the manufacture of wood-screws.

Some time during the year 1831, Mr. Washburn, Mr. Goddard and General Heard visited North Providence, where three brothers—Clement O., Curtis and Henry Read—were making wood-screws under a patent which they owned. An arrangement was made with the Reads, and they moved the screw machinery to the Northville Factory at Worcester. It was brought from Providence on a canal-boat, the journey occupying three days.

Meantime, in August, 1831, Washburn & Goddard sold their business in School Street, and moved to Northville, where the manufacture of wire and wood-screws was begun, the wire being manufactured by Washburn & Goddard, the screws under the name of C. Read & Co., with whom Mr. Washburn had an interest. Washburn & Goddard at the same time manufactured card-wire.

Some time between April, 1836, and March, 1837, the screw business was removed to Providence, where it continued for a time under the name of C. Read & Co., but ultimately became the nucleus of the "Eagle," now the "American Screw Company," which has since acquired a world-wide reputation.

Mr. Washburn states, in his autobiography, that the first wire-machine he ever saw was one of self-acting pincers, drawing out about a foot, then passing back and drawing another foot. With this crude machine a man could draw about fifty pounds of wire per day. For this Mr. Washburn substituted the wire-block, which is in use at the present time.

The process of wire-drawing consists in taking a coarse wire rod and drawing it through a hole of less diameter than the rod, in an iron or steel plate, and repeating the operation until the rod is reduced to wire of the required size. The reduction is effected by stretching the wire, and not by removing the metal.

At the present day a piece of steel four inches square and three feet long is rolled into a two hundred pound coil of No. 6 rods, measuring about two thousand and forty-six feet. This rod, by the process

of drawing from No. 6 to No. 12, is increased in length to 6,848 feet. The diameter of the No. 12 wire is .105, while the billet from which it is made has a sectional area of sixteen square inches.

Mr. Washburn, at this time, happened to be in New York, when Phelps, Dodge & Co., with whom he had business, said to him that they were starting a wire-mill, and expected to make all the wire that would be wanted in the country, and predicted failure for his mill in Worcester.

January 30, 1835, the partnership was dissolved, Mr. Goddard retaining the factory at Northville for the manufacture of woolen machinery, while Mr. Washburn continued the wire business in a factory built for him, by the late Stephen Salisbury, on Mill Brook, which was dammed for the purpose of providing water-power, thus forming what is now known as Salisbury's Pond. The earth removed to make a basin for the pond forms the high ground now found upon the south side and included within the boundaries of Institute Park.

The building erected by Mr. Salisbury was eighty feet long and forty feet in width, three stories high in the centre, with a sloping roof, two chimneys and surmounted by a cupola containing a bell.

In 1835 Charles Washburn came from Harrison, Me., where he was practicing law, and formed a co-partnership with his brother Ichabod, which continued until January 13, 1838. Meantime Benjamin Goddard discontinued the manufacture of woolen machinery, and the Northville mill came into Mr. Washburn's possession. He then made a contract with Mr. Goddard to draw wire for him, and wire machinery was again set up in the Northville factory.

About the year 1840 Mr. Washburn bought the water-power and property now occupied by the Worcester Wire Company at South Worcester. Mr. Goddard took charge of the mill, and retained that position till his death, in 1867, and all three of his sons worked there,—Delano, who afterwards became the accomplished editor of the *Boston Advertiser*; Henry, who is now at the head of an important department at the works of the Washburn & Moen Manufacturing Company; and Dorrance, who for many years was superintendent of the South Works of the corporation.

The South Worcester Mill was a one-story building, about fifty feet long and thirty feet wide. Card-wire was here drawn to No. 19 size, and brought to Grove Street to be finished. Coarser wire, for machinery and telegraph purposes, was also drawn at South Worcester.

At the Worcester County Cattle Show, held in October, 1838, Ichabod Washburn exhibits very excellent wire Nos. 30, 31, 32 and 33, and also iron wire cards.

In 1842 Charles Washburn again became a partner in the business. February 13, 1845, the old wire-mill in Northville, then used as a cotton-factory and

*P. M. Allen*

occupied by William Crompton, was totally destroyed by fire.

In February, 1847, Prouty & Earle had a wire-factory at Washington Square; subsequently it was purchased by I. & C. Washburn.

At this time the demand for telegraph-wire commenced. From 1847 until 1859 it was mainly of No. 9 size, Stubs' gauge. It was not galvanized at first, but was sometimes painted or boiled in oil, for the purpose of retarding the inevitable process of oxidation. A more complete preservative was later found in zinc, applied by the process known as galvanizing. At first this was somewhat crude, and consisted in dipping the coils of wire in molten zinc, after which the surplus metal was shaken off by violent pounding.

From 1837 till 1847 Ichabod Washburn purchased in Sweden his wire-rod billets, which were bars of iron about twelve feet long, one and one-eighth inch square in section, and these were rolled into wire-rods at Fall River, Troy and Windsor Locks, Conn. The inconvenience of having the rolling done at a distance led Ichabod and Charles Washburn, in 1847, to look about for a location for a rolling-mill.

Attracted by the water-power at Quinsigamond, a small part of which was then used by the lower paper-mill remaining at that place, they purchased the whole property of the Lincoln family, thus acquiring what they deemed reliable power, and, at the same time, plenty of room for the location of all the buildings necessary for their purposes.

Under their patronage a new firm was organized to carry on the rod-rolling and wire business, under the title of Washburn, Moen & Co., a firm composed of Henry S. Washburn, Charles Washburn and Philip L. Moen. This company was dissolved January 12, 1849, the business being continued by Henry S. Washburn.

January 1, 1849, the co-partnership theretofore existing between I. & C. Washburn was dissolved, the manufacture of wire in its various branches being continued at the Grove Street mill by Ichabod Washburn. A division of the property was had, Charles Washburn taking Quinsigamond. February 9, 1849, he offered to rent for a term of years "the building with water-power sufficient for driving machinery for a sash and blind-factory, or any other business not requiring a very great water-power." At the same time he offers for sale the entire machinery for the manufacture of paper in the said building.

This was the lower of the two paper-mills, which for many years had been run at this point by the Burbanks, and was located in what is known as the scrap-yard of the Washburn & Moen Manufacturing Company, about forty feet south of a well, which is now constantly in use and which afforded water for the operatives in the paper-mill. The end of the mill was parallel with the railroad, and was only separated from it by the width of the old race-way, and stood at a point about four hundred and sixty feet

southeast of the traveled highway, as it crosses the railroad.

April 1, 1850, Philip L. Moen became a partner with Mr. Ichabod Washburn, and has been actively engaged in the business from that time.

In July, 1851, a Mr. Adams had a wire-factory opposite the Norwich depot, but no further notice of it is to be found.

January 2, 1853, Henry S. Washburn formed a co-partnership with Charles F. Washburn, and they continued at Quinsigamond rolling rods and manufacturing iron and wire under the firm-name of Henry S. Washburn & Co. Meantime, Ichabod Washburn had made considerable progress in the manufacture of wire, particularly of card-wire, introducing new and improved processes. This was made of Swedish bars one and one-quarter inches square, which were rolled at Quinsigamond into wire rods of a little less than one-quarter of an inch in diameter; they were then carried to the wire factory at South Worcester and Grove Streets, and drawn to the necessary sizes. The capacity of this rolling-mill was about six long tons per day of ten hours.

Early in his experience as a wire-drawer Mr. Washburn adopted certain improved processes for annealing,—that is, restoring the wire, as it became hard and brittle, by repeated drawing to its original soft and pliable condition,—by heating in cast-iron pots and cooling slowly. This improvement consisted in placing the small coils in double air-tight iron-pots.

In 1850, at the suggestion of Mr. Chickering, of Boston, Mr. Washburn devoted his attention to the production of steel wire for piano-fortes, the manufacture of which had been previously monopolized by several English houses. These experiments were successful; and the English wire was discarded for that made in Worcester.

From that time to this the Washburn & Moen Company has been the only manufacturer of music-wire in this country.

In February, 1856, the Quinsigamond Mills consisted of a building one hundred and fifty feet front with two wings extending back one hundred and fifty feet, between which was a hoop building, sixty by thirty feet; these with coal-houses and yards covered more than an acre of ground. Here were manufactured Brazer's screws, rivet rods, bright and annealed market and telegraph, spring, fence, buckle and bail wire; also fine hoops. The daily product was ten tons; eighty-five operatives were employed and one hundred horse-power was supplied by three water-wheels. The annual product of the mill was valued at three hundred thousand dollars.

The first continuous tempering done by Mr. Ichabod Washburn was in 1856, in the rear of his Summer Street residence; this was music wire, and the hardening was done in water. Early in 1857 the furnace was removed to the old gymnasium in Orchard Street and oil was substituted for water.

This series of experiments led to an important invention in the process of hardening and tempering continuously. Hitherto this had only been done when the steel wire was in the form of a coil by subjecting it first to high heat, and then cooling in oil or water.

But the pressure for music wire and for crinoline wire now coming upon him, the old process became too slow and expensive to be endured, and it became necessary to adopt some more efficient method. This was found in the continuous process of hardening and tempering, which he patented, and which, without any substantial improvement or change has been universally adopted, rendering possible many results which could not otherwise have been reached.

In 1857 the partnership of Henry S. Washburn and Charles F. Washburn was dissolved, and May 1st, of that year, Charles Washburn and Charles F. Washburn formed a co-partnership under the name of Charles Washburn & Son, and continued in business at the Quinsigamond works. Henry S. Washburn remained in the wire business, and occupied as a factory one of the buildings erected by Nathan Washburn near the freight depot of the Western Railroad.

C. Washburn & Son then manufactured most of their common market wire from scrap iron piled on boards eighteen by eight inches, heated to a welding heat, and rolled into billets which were re-heated and rolled into rods.

The only appliances in their mills for the production of wire rods were three heating furnaces and a large train of two rolls, in which the pile of heated scrap was rolled to one and one-eighth inch billets of one hundred pounds weight; and a small train of rolls three high, by which these billets were rolled to three and a half by four Stubs' gauge wire rod.

Experiments in the burning of peat were made by Henry S. Washburn & Co., and by I. Washburn & Co., but it did not prove a satisfactory substitute for coal.

In July, 1859, I. Washburn & Company employed one hundred and twenty hands in the Grove Street mill, and made three tons of iron wire per day. They were erecting a new mill three stories high, eighty feet by forty feet, and were also making large additions to the mill in South Worcester; a new annealing house, fifty feet by thirty feet, two stories high, together with additions to the main building.

**CRINOLINE WIRE.**—The crinoline wire business commenced about 1859 and lasted for ten years. This was made possible by the continuous hardening and tempering process invented by Mr. Washburn, which made it feasible to temper a cheaper grade of cast steel at very little additional cost, and thus substitute it for the more expensive methods before used for increasing the size of women's skirts. This enabled the skirt-makers to put their goods on the market furnished with steel hoops of great toughness and elasticity, and at a price which put them within

the reach of the poorest; consequently, this line of business was largely increased until about 1870, when other fashions came into vogue and the consumption of tempered steel in this form steadily decreased. For several years the annual output of tempered crinoline wire was one thousand five hundred tons annually, making this company the largest consumer of cast steel in the country.

About 1860 Mr. Washburn introduced continuous annealing, cleaning and galvanizing. This was an English invention and a great improvement upon the processes previously used, being of especial value at that time in the manufacture of telegraph wire.

In November, 1862, the iron and wire works of Chas. Washburn & Son, Quinsigamond, were totally destroyed by fire.

In 1863 I. Washburn & Moen built a cotton-mill, which was run for about ten years, producing yarn sufficient to cover four tons per day of tempered crinoline wire.

In 1864 I. Washburn & Moen controlled the works at Grove Street and South Worcester, but had no rolling-mill. Their business was confined to iron and cast steel of different grades, Bessemer steel and open-hearth steel being introduced many years later.

January 2, 1865, I. Washburn & Moen changed the co-partnership to a corporation under the style of I. Washburn & Moen Wire Works, organized for the purpose of manufacturing wire and wire rods. Capital stock, \$500,000.

August 4, 1865, the Quinsigamond Iron & Wire Works, which succeeded to the business of Chas. Washburn & Son, was organized.

November 27, 1866, a petition was filed to form a corporation "for making wire and wire rods, cotton yarn and goods, with a capital larger than at present allowed." The petitioners asked to be incorporated under the title of Washburn & Moen Wire Works, with a capital of \$600,000.

July 7, 1867, the mill at South Worcester was burned and the business was conducted at Grove Street till March, 1868, when a new mill at South Worcester was in readiness. About a year and one-half from that time the company commenced the erection of most of the present buildings in Grove Street. Meantime, February 24, 1868, the Quinsigamond Iron & Wire Works and the Washburn & Moen Wire Works were consolidated under the name of the Washburn & Moen Manufacturing Company, with a capital of \$1,000,000, and authority to increase this amount to \$1,500,000, the present capital, was granted May 26, 1869.

In the fall of 1869 was built the first rolling-mill, at Grove Street. This was a "Continuous Mill," so called, and was in its essential features an English invention.

The adoption of Bessemer steel, which occurred in 1876, created a revolution in the wire business, substituting, as it did, a better and cheaper material for

very many purposes. This occurred at the beginning of the barbed wire business. The use of Bessemer steel for this purpose alone, besides furnishing a stronger wire than could be made from Swedish iron, represents a saving of at least four million five hundred thousand dollars annually to the farmers of the country.

**BARBED FENCING.**—The importance of the fence question to the people of the United States can perhaps be best appreciated by a mere statement of the results contained in the Report of the United States' Department for Agriculture for 1871, from which it appears that the cost of fencing in thirty-seven States had amounted to \$1,747,549,931, while the annual cost of repairs amounted to \$93,963,187. This together with the annual interest on the original investment at six per cent., made the total cost, exclusive of rebuilding, \$188,806,182.

The cost of fencing per rod, as stated in this report, varies from 30 cents in Alabama to \$2.20 in Rhode Island. In addition, a fence occupies and wastes, upon an average, a piece of land half a rod wide, or one acre in every fifty, making a total of not less than 50,000,000 acres in the United States.

Not only was the expense of fencing with timber enormous, but apprehension was felt that the supply might be unequal to the demands made upon it. Wire as a fencing material was recommended as early as 1821. Speaking of the wastefulness of the common method of wooden-fencing, the secretary of the New York State Agricultural Society for 1850 stated that the worm-fence took "from every one hundred acres an area of five acres."

The substitution of wire for wood as a fencing material was generally recommended on the ground that it takes up no room, exhausts no soil, shades no vegetation, is proof against high winds, makes no snow-drifts, and is both durable and cheap.

As the necessity for a cheap fencing material increased, efforts to supply the need also increased. Up to 1881 twelve hundred and twenty-nine patents had been issued relating to fencing, and more than two-thirds of that number since 1865.

The first patent was in 1801, and up to 1857 about one hundred had been issued, while in 1866, '67 and '68 three hundred and sixty-eight fence patents were issued.

In examining the patents issued it is found that of the twelve hundred and twenty-nine issued up to 1881 forty were to inventors in the New England States; three hundred and seventy-two to the Middle States; one hundred and eight to the Southern States; and six hundred and ninety-six to the Western States; eight to the District of Columbia and five to Canada.

Of the States, Ohio had the greatest number, two hundred and forty-one; followed by New York, two hundred and thirty-one; Illinois, one hundred and forty-two; Iowa, ninety-six.

Up to 1873 plain No. 9 round wire was largely used in the West as a fencing material and thousands of tons of it were in use, but it was not satisfactory. It stretched in warm and contracted in cold weather, which was the cause of constant breakages; furthermore, cattle could rub against it with impunity, and this constant pressure loosened the posts and broke the wire.

In the fall of 1873 the manufacture of barbed-wire was begun in a small way at DeKalb, Ill., by Mr. J. F. Glidden, who was a farmer in that town. He first made a few rods of fencing and put it up on his own farm in November, 1873. The process was very crude when compared with the present method of manufacture.

The barbs were first formed by bending around a mandril and then slipped upon one wire of the fence; the second wire was then intertwisted with the first; this locked the barbs in place and prevented lateral as well as rotary motion. The fencing was made in sixteen-foot lengths, and as there was no means for coiling it on spools for transportation, it was carried to the point where it was to be put up, and then enough of these sixteen-foot lengths were spliced together to give a fence of the desired length. The first piece actually sold for use was in the spring of 1874. Three boys and two men were able to make fifty pounds per day. In June, 1874, it was arranged to do the twisting by horse-power, and this increased the product of three boys and two men to one hundred and fifty pounds per day.

In the latter part of 1874 a rude hand-machine was devised for twisting the barb upon the main wire and spooling the product, which was subsequently unwound and twisted with a second wire and then spooled again. By the use of the latest machinery, one man will now produce two thousand pounds, or over five and a half miles, in ten hours.

In the spring of 1876 the attention of the Washburn & Moen Manufacturing Company having been called to this new article of manufacture and impressed with its value, automatic machinery was constructed and patented, and the control of the underlying barbed-wire patents was acquired. These patents were,—one to L. B. Smith, of Ohio (June 25, 1867), in which the barb consists of four radially projecting points from a hub, which is prevented from moving laterally by a bend in the main wire. Patent granted to W. D. Hunt, of New York, in which a single fence wire is armed with spur-wheels which can revolve upon the main wire. Patent to Michael Kelly, of New York, dated February 11, 1868; this is the first patent to show two wires twisted together. The barb was made of a lozenge-shaped piece of sheet metal and was strung upon the main wire, while for strength, a second wire was intertwisted with the first. This inventor showed a most intelligent conception of the subject matter of his invention, as appears from the following quotation taken from his specifications:

I can, by this invention, make an efficient fence from unconnected wires, six inches apart, fixing the artificial thorns on the wires four inches apart. This fence takes only one-fourth as much wire as in ordinary wire fences, yet it is more efficient. This fence will weigh about one-eighth as much as ordinary connected wire fence, by which I mean those woven or twisted together. It can be wound on a reel, like telegraph wire, and a farmer can transport as much in a single wagon-load as will serve to build fences for a large farm.

The next patent in point of date, and chief in importance, is the patent to Glidden, dated November 24, 1874, in which is for the first time found a barb, made of wire wrapped about a fence wire, and locked in place by a fellow wire intertwined with the first. Meantime, barbed wire was growing in popularity; at first, strong prejudices had to be overcome. Many hardware dealers would not have it in their stores. The public, too, had to be educated. A length of barbed wire, with two barbs upon it, was shown to two men in Texas; one guessed it was a model of a fence, the barbs being the posts, and another thought it was a bit for a horse.

A skeptical farmer said he didn't believe it amounted to much; that he had a bull (Old Jim) who would go through anything, and he guessed he wouldn't stop for barbed wire. His field was fenced; "Old Jim" shook his head, elevated his tail, and went for it. The farmer was converted, and so was "Jim."

Barbed wire, once introduced, grew rapidly in favor. In fact, it became a necessity; strong, durable, cheap, easily transported, and an absolute barrier against man and beast, it became at once the best fencing material known, and the demand for it rapidly increased. Meantime, infringers began to spring up, and litigation followed. No stronger or more persistent efforts were ever made to break down a patent property than were directed against the barbed wire patents.

Thousands of pages of testimony were taken upon alleged cases of prior use all over the West and in Texas. The greatest interest was taken in the cases involving, as they did, the control of what even then bade fair to be a most important industry.

The defence relied upon establishing the alleged cases of prior use, and also insisted strongly that there was no invention in arming a wire with pricking spurs. The United States Circuit Court for the Northern District of Illinois, in December, 1880, sustained the patents, and this gave the Washburn & Moen Manufacturing Company, and their associate, Isaac L. Ellwood, of DeKalb, Ill., the control of this business. Licenses were issued to most of the parties lately infringing, and the business has been conducted upon that basis up to the present time, and will be during the life of the patents, some of which do not expire for several years.

To protect themselves and their licensees, the Washburn & Moen Manufacturing Company has purchased upwards of two hundred and fifty patents upon barbed wire and barbed wire machinery.

The amount of barbed wire consumed in this country has increased from five tons, in 1874, to a probable output of one hundred and fifty thousand tons, over eight hundred and fifty thousand miles, in 1888. Of this amount, the Washburn & Moen Manufacturing Company makes about eighteen thousand tons (over one hundred thousand miles), while the capacity of their works is seventy-five tons per day of ten hours, or four hundred and twenty-six miles. The cost to the consumer has during this time been reduced from eighteen cents per pound to less than five cents. This has resulted from the reduced price of wire and the introduction of automatic machinery.

**BALE TIES.**—About the time that barbed wire began to be manufactured the company became the owners of patents upon bale ties, a wire substitute for the wood and rope previously used. There are probably to-day ten thousand tons used annually for binding hay in the United States.

Each ton of wire will wind three hundred and thirty tons of hay or straw, and the whole ten thousand tons of wire will bind three million three hundred thousand tons of hay and straw.

It formerly cost on an average to press this amount, when bound with rope, two dollars per ton. Wire is applied to the bales with so much greater ease than wood or rope, that a saving of fifty cents per ton, at a low estimate, is effected in pressing hay when wire ties are used. But the greatest saving made to the public by the introduction of wire for binding purposes is in the increased security against loss by fire. When hay, straw or tow are bound with rope or wood, each is easily set on fire, the binding material burns, and thus allows the compressed mass to become loose and add fuel to the flames. This, of course, is not the case when wire is used. For this reason, rope and wood were discarded many years ago in pressing cotton.

Altogether, millions of dollars are saved annually to the public by the introduction of wire ties, all of which has been effected in the last twelve or fourteen years.

**COPPER WIRE.**—Since 1884 copper wire has taken a prominent place among the products of this company, as it has been and is being largely substituted for iron, particularly in long-distance telephoning and electric lighting.

Copper has always been preferred to iron for electric purposes by reason of its greater conductivity, but previous to the introduction of hard-drawn copper wire it did not possess the requisite strength. By present processes a copper wire of sufficient strength can be produced much lighter than iron, and of largely increased conductivity, as is apparent when the fact is stated that for a given length of wire an equal degree of conductivity will require five times as much weight in a mile of iron as of copper wire.

In January 1884, there were probably not more

*Charles F. Washburn*

than one hundred or two hundred miles of hard-drawn copper wire in use in this country. To-day there are, it is estimated, at least fifty thousand miles, representing about four thousand two hundred tons of metal, now in operation by the various telegraph and telephone companies, the average weight per mile being about one hundred and seventy pounds.<sup>1</sup>

The larger sizes of copper wire are used in connection with electric railways.

**WIRE ROPE.**—Among the more recent specialties introduced by the company is wire rope, of which is manufactured: galvanized steel wire cable for suspension bridges; phosphor-bronze and copper wire rope; transmission and standing rope; galvanized wire seizing; hoisting rope; tiller rope; switch rope; copper, iron and tinned sash cord wire; clothes-lines and picture-cords; galvanized iron wire rope for ships' rigging; galvanized crucible cast-steel wire rope for yachts' rigging.

The rapid introduction of cable railways has created another demand for wire rope.

**WIRE NAILS.**—The manufacture of wire nails is another branch of business conducted by the company. The wire nail, as an article of manufacture, was scarcely known in this country ten years ago. Since that time it has come into general use, and it is estimated upon good authority that more wire nails are used to-day than cut nails. The variety is very large, running from three-sixteenths of an inch, made from No. 22 iron, to a length of fourteen inches, made from No. 000 wire.

It is a little remarkable that the introduction of two articles of manufacture—barbed wire and wire nails—should within the last fifteen years have created a new demand for wire, amounting to at least two hundred and seventy-five thousand tons per annum, which has been made possible by the use of Bessemer steel.

While the process of drawing wire is, in principle, the same as practiced fifty years ago, many improvements have been made leading to a largely increased relative product. Great advances have been made in certain of the mechanical processes, particularly in the rolling of wire rods. In 1846 the first rolling-mill at Quinsigamond produced about five tons of No. 4 rods in ten hours; at the present time the output is from forty to fifty tons in the same time.

The demand for wire and the purposes for which it is used have largely increased, as indicated by the present output of two hundred and forty-five tons daily, and the manufacture of four hundred and eighteen different kinds of wire.

The increase in the business of the corporation has been most rapid since the introduction of barbed wire. In 1875 the number of hands employed was seven hundred; in 1880 two thousand one hundred, and at

the present time, 1889, there are three thousand names on the pay-roll of the company, for the most part heads of families, supporting directly not less than thirteen thousand persons, and indirectly, a much larger number.

Of the operatives, one thousand are Irish; nine hundred Swedes; five hundred Americans; two hundred and thirty-six Armenians; forty-five Germans; other nationalities, three hundred and nineteen.

The buildings of the corporation cover twenty-five acres of ground, and the machinery is driven by engines of seven thousand two hundred horse-power. The present officers of the corporation are: Philip L. Moen, president and treasurer; Charles F. Washburn, vice-president and secretary; Philip W. Moen, assistant treasurer and general superintendent; Charles G. Washburn, assistant secretary and counsel. The above, with George T. Dewey, Esq., constitute the board of directors.

The Worcester Wire Company, William E. Rice, president and treasurer, is located on the Old South Worcester privilege, utilized for manufacturing purposes from the earliest times. Here is manufactured a variety of wire, including tedder, rake teeth, wire for hay bales, and barbed fencing, bridge rope and general wire; bottling, baling wire; tinned mattress, tinned broom wire, harvesting wire on spools; wire for the manufacture of screws, bolts, rivets, nails, buckles, staples, rings, hooks and eyes, pin, hair-pin, reed, harness, heddle, bonnet, brush, broom, hat, clock and umbrella wire; also telegraph and telephone wire.

Wire-working as an industry in Worcester was contemporaneous with wire-making.

In April, 1831, Jabez Bigelow manufactured, in Rutland, "wire sieves, such as meal sieves, sand riddles, etc., also manufactures all kinds of safes for meat and provisions."

In 1834 he was located at the Stone building, Front Street, on the canal, where he manufactured "meat, milk, cheese and provision safes, wire sieves, grain, coal, sand, sugar and bakers' riddles. Fire fenders, sand screens, hatters' hurls, dusters for paper-mills, cellar and window guards, netting, wire lace, bird cages, plate covers and brass screens."

In the following year Mr. Bigelow advertised for two girls who could take a loom to their dwelling.

In 1845, Mr. Samuel Ayres began to weave wire for Mr. Bigelow in a shop in Norwich Street. Mr. Bigelow then had three looms—one large and two small ones—and the business employed in all six hands, among whom were Mr. Bigelow's sons.

The business of wire-working was subsequently conducted by several firms, and finally consolidated in the National Manufacturing Company, of which Mr. Jonah H. Bigelow, a son of Jabez Bigelow, is president. This company has conducted a prosperous business for many years, manufacturing a very large variety of wire goods.

<sup>1</sup> "Pocket Hand-Book of Copper and Iron Wire," published by W. & M. Manufacturing Company, 1888.

The business now conducted by the Wire Goods Company was commenced by Charles G. Washburn in the fall of 1880, on the top floor of the building then and now occupied by C. H. Hutchins & Company, in Allen's Court. The articles manufactured were wire goods for cotton and woolen machinery.

September 12, 1882, it was incorporated under the name of The Wire Goods Company, and was continued for a time in Allen Court, but was subsequently moved into the brick factory in Union Street, the present situation. Meantime, the business has very much enlarged, employing at the present time one hundred and twenty hands. In 1888 the business of the Ayres Manufacturing Company was purchased and merged in that of the Wire Goods Company. Among the articles manufactured are bright iron and brass gimlet-pointed wire goods of all kinds. Belt hooks, hitching rings, hand-rail screws, hammock hooks, double-pointed tacks, a large variety of wire goods and a number of patented specialties; in fact, "everything in wire." Mr. A. W. Parmelee is president and treasurer of the company.

Hamblin & Russell, in Front Street, are also engaged in the manufacture of a variety of wire goods similar to those made by the National Manufacturing Company.

Henry E. Dean, Austin St., manufactures a special line of general hardware and house goods, elevator and window guards, also all kinds of steel wire brushes.

Another use to which wire is put in Worcester is the manufacture of rivets and burrs, which is conducted by Reed & Prince, 42 Gardner Street, in the basement of the pistol factory. This industry was established in 1886.

It would be difficult to enumerate the variety of articles and machinery, manufactured in Worcester, into which wire enters in one form or another.

**COPPERAS.**—An interesting illustration of the utilization of waste products is found in the manufacture of sulphate of iron or green vitriol—commonly known as copperas, and popularly, but erroneously, supposed to be a salt of copper—from the waste sulphuric acid used in cleaning wire. This waste acid, heavily charged as it is with iron, is taken to the works of W. E. Cutter & Co., where, after being evaporated in lead-lined tanks in which iron in the form of waste wire has been placed to further neutralize the acid, is drawn off into large cooling-tanks, and the copperas is deposited in green crystals upon sticks suspended in the liquid. Copperas is used in dyeing as a disinfectant, and in the manufacture of ink, and largely in the manufacture of Venetian red, also made by W. E. Cutter & Co. 7,000,000 pounds of copperas are manufactured by this company annually, representing about 700 short tons of metallic iron; about one-third of the copperas is converted into Venetian red, of which the annual product is 2000 tons. This is an oxide of iron paint, and is very extensively used.

Copperas can also be obtained by the oxidation of iron pyrites—sulphate of iron. In 1830 a bed of iron pyrites was discovered in Hubbardston, and Mr. Bennett, of that place, with Messrs. John Green, Benjamin F. Heywood and James Green, of Worcester, formed a company for the manufacture of copperas, and began operations; but the enterprise did not prove successful. In December, 1828, the canal boat "Worcester," Captain Green, among other things, brought one ton of copperas from Providence.

#### MANUFACTURING AND MECHANICAL INDUSTRIES.

*Carriages and Cars—Wood-working Machinery—Musical Instruments—Envelopes.*

**CARRIAGES AND CARS.**—The business of carriage-making was conducted in Worcester at a very early day. Curtis & Goddard were in business in 1808.

In 1822 Osgood Bradley came to Worcester, and started the stage and carriage business in a small shop in the rear of what is now Parker Block in Main Street, and the same year moved into what is now known as Atchison's carriage-shop in School Street, where he manufactured and kept on hand mail-coaches, chaises, gigs, wagons, sleighs, cutters, etc. Associated with Mr. Bradley was John Manning, harness-maker, who afterwards, in 1825, went into business with Edward M. Burr, in the manufacture to order of coaches, chaises, saddles and harness, opposite Stiles & Butman's store, a few rods north of the brick hotel.

Osgood Bradley & Co. continued in the manufacture of coaches, chaises and harnesses in School Street, near Captain Thomas' coffee-house, and were succeeded by Solon Fay, September 2, 1829.

Albert Tolman was born in Lincoln, Mass., and came from Concord to Worcester in 1833. At this time, it must be remembered, manufacturing in Worcester was in a very primitive condition; the shops were all very small, and the proprietor, with one or two workmen and an apprentice, usually did the work.

In 1833, Mr. Tolman formed a co-partnership with Mr. Samuel L. Hunstable, and advertised to do chaise and harness-making in the yard of the Central Hotel. At this time a Mr. Goddard had a harness shop north of the Bay State House, near where the Waldo Block now is. Benjamin Goddard was a carriage maker, and had a shop on the corner of Waldo and Exchange Streets, where Walker's ice office now is.

A Mr. William Leggett was at that time an old harness-maker here, and was afterwards one of the first conductors on the Nashua Railroad. The firm of Tolman & Hunstable continued until 1837, when the firm

of A. Tolman & Co., was formed, composed of A. Tolman and G. W. Russell, which continued forty years. Their work for many years was the manufacture of first-class family carriages, which they sent all over the world, some of them going to California, and even to Africa and Australia. Mr. Tolman once built a carriage for Mrs. Governor Duncan, of Ohio, before the days of railroad communication; it was shipped to New Orleans, and from there went up the Ohio River to its destination. Now hundreds of carriages come from Ohio to the East by rail.

Meantime Mr. Bradley had again gone into business, and in 1838, Osgood Bradley sold out his business to Rice, Breck & Brown, and prior to 1842, Bradley & Rice engaged in the manufacture of railroad cars, near the Western depot. This factory, which was one hundred and thirty feet by forty feet, was destroyed by fire, May 12, 1842. Mr. Bradley resumed business alone in 1849, and in 1850 had in his employ about one hundred men. His work was done in half a dozen buildings scattered over two and a half acres of ground, and at this time he had in process of construction from sixteen to eighteen passenger cars at an average price of three thousand dollars, besides a large number of freight cars.

Mr. Bradley continued in business alone until January 1, 1883, when he took into partnership his sons, Henry O. and Osgood Bradley, Jr., the firm being Osgood Bradley & Sons. Mr. Bradley remained in the firm until his death, in 1884, the firm-name continued and his sons carrying on the business.

Mr. Bradley built the first railroad cars in this country at his shop in School Street. He built four cars for the Boston & Worcester Railroad, one of which was drawn to Boston over the old turnpike road by four horses.

In 1847 Abraham Flag, at his shop, 22 Exchange Street, manufactured I. Woodcock's patent "Worcesterree," a two-wheeled vehicle. Woodcock, Jones & Co. also manufactured them.

In 1851 the carriage business in Worcester supported about fifty families. The largest factory was that of Tolman & Russell; it embraced some half-dozen buildings and gave employment to twenty-five hands. Most of their carriages were of the more expensive kind. At this time they were finishing three, one for the Adams House, Boston; one for a New Bedford merchant, and one for Mr. White, of Worcester, "the attentive and obliging hackman, whom everybody knows and everybody employs." Besides these heavier carriages, Tolman & Russell manufactured a great many lighter vehicles of various patterns and prices, such as chaises, phaetons, rockaways and buggies. It is said that this firm at one time refused to take a large contract from the Government for the supply of army wagons for the use of the army during the Mexican War, solely on the ground that they believed the war to be unjust and did not wish to participate in the profits of such injustice.

The average number of vehicles manufactured by Tolman & Russell at this time was about one hundred per year.

The establishment of Breck & Wilder was situated in School Steet, employing somewhat fewer hands than Tolman & Russell. Their shop occupied the site formerly occupied by Osgood Bradley, and their business was confined especially to omnibuses and stage-coaches. They built some of the largest omnibuses running between Boston and the adjacent towns, and had, in April, 1851, just finished an omnibus of immense proportions, named the "Jared Sparks," intended to run on the line between Cambridge and Boston.

George W. Wilder built a new light carriage known as the "York wagon." William C. Whiting's carriage factory, in Mechanic Street, employed ten hands on light carriages of all descriptions.

More recently, Tolman & Russell have confined themselves almost entirely to the manufacture of hearses, which find a market in all parts of the United States.

Mr. Tolman retired from the firm in 1879. The business is now conducted by H. J. & J. E. Russell.

Under the old apprentice system in this business, boys were taken from fifteen to twenty-one years of age, and were paid from thirty to fifty dollars a year and their board. They bought their own clothes, and the last year of their apprenticeship were paid seventy-five dollars, which included a "freedom suit."

About 1830 the working day averaged from twelve to thirteen hours, and all the work was hand-work, down to the rivets and bolts. The average wages of a good workman, \$1.25 per day.

As late as 1866 a good many carriages were made by O. Blood & Sons, Tolman & Russell and Geo. T. Atchison, but most of the carriages used in this city and county were bought in Boston.

The best carriages sold to-day in Worcester are made in Merrimac and Amesbury, Mass. Cheaper carriages come from the western part of New York and the Western States. These are kept in stock by the different carriage depositaries, and probably a thousand sold yearly to supply the demand in the city and county,

George C. Dewhurst who established the first regular depositary in Worcester, manufactures sleighs. The business of Geo. T. Atchison is largely in the manufacture of water-carts.

**WOOD-WORKING MACHINERY.**—The automatic wood-planing machine was invented by William Woodworth in 1828.

Previous to 1836 the manufacture of wood-working machinery was not carried on as a separate industry in any part of the United States. In that year the firm of J. A. Fay & Co., composed of J. A. Fay and Edward Josslyn, commenced the business in Keene, N. H., and a few years later united with the firm of C. B. Rogers & Co., at Norwich, Conn.

In April, 1839, Thomas E. Daniels was located at Court Mills, manufacturing his patent planing-machines, "which are useful in squaring out timber for machinery, planing floor and other boards, door, bed-stead and table stuff; also for hollowing circles for water-wheel roundings and drum locks; he also builds machines for matching boards, grooving floor plank, and under floor plank, where it is desirable to put mortar between floors in factories to prevent fire; recommended by Davis & Howe; Ruggles, Nourse & Mason; White & Boyden; Henry Goulding & Co.; Horatio Phelps." He sold out his business to Deacon Richard Ball and Thomas Rice, who were succeeded by Ball & Ballard.

In 1843, Goddard, Rice & Co., put in the first planing-machine that went by power in Worcester County. In October, 1846, Arad Woodworth, New Worcester, showed a machine for planing window blind shades; and in 1847, Charles Price, successor to Price & Hartwell, was engaged in building planing-machines at No. 2 Central Street.

In 1849 Howe, Cheney & Co., at Court Mills, had made arrangements to build the Daniels Planing Machine, to plane all wood from eight to ten inches wide, and from four to fifty feet in length.

At the Mechanics' Exhibition in 1851, Ephraim C. Tainter exhibited a Daniels Planer embodying many improvements. His factory was at the Junction shop, and he was soon after joined by Mr. Gardner Childs, who, in 1853, sold his interest to the Keene and Norwich companies already referred to, and the business was conducted as a branch under the name of J. A. Fay & Co., who also manufactured plows, power and foot mortising machinery, tenoning and sash-moulding and matching-machines. The machines of their manufacture became known throughout this country and in Europe. In December, 1858, they were building a fifty-foot planer and other machinery for the Don Pedro Railroad in Brazil.

In 1858, and prior to that time, Ball & Williams (Richard Ball and Warren Williams), successors to Ball & Ballard, were engaged in School Street, in the manufacture of planing-machines for wood-working and of improved sash and moulding-machines. They had just sent an improved Woodworth planer to R. Hoe & Co., of New York. Warren Williams retired in 1865. Mr. Ball, with his son-in-law, built the factory in Salisbury Street, now occupied by Witherby, Rugg & Richardson.

In 1859 J. A. Fay & Co. occupied one hundred feet of the second floor of Col. Estabrook's shop at the Junction, and employed thirty hands in making wood-working machinery, and had then recently sent a saw-mill to Rio Janeiro.

In 1859 Mr. Fay died, but the business was carried on by his widow and the remaining partners.

In 1864 they opened a warehouse at 107 Liberty Street, New York, for the sale of their products, and were the pioneers there in this line of business.

In 1877 William B. McIver and his brother, J. C., purchased the tools, stock and good-will of the old firm and continued the business under the name of McIver Bros. & Co. They engaged in the general manufacture of wood-working machinery on a more extensive scale than had been done in the former companies. McIver Bros. & Co. now occupy the shop below the Junction, built by Wood, Light & Co., and in addition to their other business are largely engaged in the manufacture of coffee machinery for Central America and other coffee-growing countries.

Witherby, Rugg & Richardson began business in 1864, in the Armsby building, with twenty men, and employ at this time, at their location in Grove Street, seventy-five men. They make a large variety of wood-working machinery, which goes to all parts of the country.

**MUSICAL INSTRUMENTS.**—The principle of producing music by the vibratory motion of a reed is most simply illustrated in the jewsharp, and the development of this principle through the successive stages of harmonium, accordion, elbow melodeon, with foot-pedal for working the wind-chest, has resulted finally in the cabinet organ of to-day. This development has taken place within the present century.

The business of organ-building has been conducted in Worcester for more than forty years. In 1847 Mr. N. B. Jewett was engaged here in making melodeons, and in 1849 Mr. Milton M. Morse, who came from Concord, N. H., manufactured seraphines, melodeons and eolians for church and parlor use. The first melodeon was copied from the accordion. Mr. Abraham Prescott, of Concord, N. H., manufacturer of bass viols and violoncellos, made an accordion for Mr. James A. Bazen, of Canton, who thereupon had an enlarged one made by Mr. Morse, then in his employ.

In 1847 the firm of Farley, Pierson & Co., consisting of John A. Farley, John G. Pierson and M. M. Morse, began business, which was conducted in the old Burnside Building, in Main Street. The first cases for this company were made by Partridge & Taber. The first melodeon made was a four-octave melodeon, held in the lap, with two rows of keys, sharps and flats. The round keys were pushed in like the keys upon the small concertinas which are made now. The sharp keys had black rings painted on the ivory. The melodeon was held in the lap, and, while the keys were operated by the hands, the elbows worked the bellows. These instruments were greatly enlarged until they were put upon legs and called seraphines, the bellows still being worked with the elbows.

The cabinet organ is the melodeon on a large scale. Modern instruments have the exhaust bellows, while the old instruments have the pressure bellows. At the beginning this company had six hands; Mr. Morse did the tuning, Mr. Farley made the reeds, and Mr. Pierson the wood-work. Subsequently, in 1852, Pierson & Loring succeeded to the business.

One of the first melodeon-tors made by this company was twenty-two inches long, twelve inches wide, with four octaves. The bellows were made in two folds; when the wind went out of one fold it came in and filled the other. At the last New England Fair one of these instruments, made forty years ago, was shown and operated.

Taylor & Farley were manufacturing melodeons in 1855, and in 1862 harmoniums for parlors, churches and schools. In 1865 their factory in Hermon Street was erected.

In 1856, the Steam Music Company was formed to manufacture the calliope, an instrument designed to produce music by steam—the invention of a Mr. J. C. Stoddard.

In June, 1858, E. Harrington & Co., at the Junction shop, manufactured melodeon reeds, succeeded by A. Davis & Co.

In 1859 the American Steam Music Company was located in Estabrook's building and employed twelve hands in the manufacture of calliopes and terpsichoreans.

"The latter is an entirely new thing, and this company has just completed the first one as an experiment. Its notes are agreeable and pleasant to the ear. The music for these instruments is arranged by M. Arbuckle, leader of Fisk's Cornet Band, on the same floor."

In 1860 the calliope was introduced into England.

The Loring & Blake Organ Company, located in Union Street, was incorporated in 1868. Messrs. Loring & Blake, the founders, were at one time with Taylor & Farley Organ Company, and first engaged in business in Southbridge Street, in French's building, and afterwards moved to the building in Hammond Street, which was later burned down and never rebuilt. From there they moved to the Adams Block, between Main and Southbridge Streets, the site of the new Post-Office, and also hired some rooms of E. S. Stone, their mill-work being done in Cypress Street. They now occupy the large five-story brick factory in Union Street.

The lumber used by this company comes comparatively dry, but they have two large dry-houses with a capacity of fifty thousand feet. From the dry-houses the lumber passes to the mill-room, is cut up into the proper sizes and glued; it then goes through the scraping and smoothing-machines. This company uses a machine for carving which does many parts of the work formerly done by hand, although some of the work can still be done cheaper by hand than by machinery. From the mill-room, with its multiplicity of saws and wood-working machinery the work goes to the case-room, adjoining which is the tuning-room; here the tuner has a set of reeds pitched, from which the reeds are fitted for the organ. Formerly the reeds were left perfectly straight, but now are bent somewhat, which is supposed to give a superior tone. This is a return to the earlier practice, as the reeds of

the first melodeons were made in this way. This company uses a patent stop motion of its own on its organs. The work of the factory is all divided into departments; the reeds and reed-boards are purchased outside, and put into cases in the factory. The bellows stock is also purchased.

The Taber Organ Company in Hermon Street—N. H. Ingraham, president, William B. Baker, treasurer,—was established in 1872 as the Worcester Organ Company. Shortly afterwards, Mr. William B. Taber, who had been with Loring & Blake Organ Company, bought the business, and later, in 1877, the Taber Organ Company was formed, starting with fifteen hands. The company now employ forty. Their product goes all over the world. The changes and improvements made in organ-building, have, for the most part, been in the styles of cases, in couplers and tremolos—the change in the latter being from the valve to the fan tremolo.

The company now known as the Worcester Organ Company is a continuation of the business formerly conducted by E. P. Carpenter, and has now commenced the manufacture of pianos. The manufacture of organ-reeds, while closely connected with the manufacture of organs, is a distinct business. Previous to 1846 reeds were made by hand. About that time Jeremiah Carhart, of New York, devised machinery for making the organ-reed to be used with exhaust bellows, which he had invented and patented. Redding & Harrington, of Worcester, also devised a machine for making the reeds. Mr. A. H. Hammond bought a one-third interest in this business and, finally, all of it. The Hammond shop, in May Street, now does a large domestic and foreign business, and employs two hundred hands.

George W. Ingalls & Co., Hermon Street, manufacture organ-reeds and reed-boards, Parker tremolos and octave couplers and fan tremolos.

The Munroe Organ Reed Company was established in 1860. It was incorporated in 1869 with a capital of \$13,300, and employed ten men. In 1875 the capital was increased to \$60,000, and in 1878 they added to the manufacture of reeds that of automatic instruments; since then they have employed something like 250 men at one time. In 1879 they moved to their present location in Union Street, where they have the most complete facilities and most ingenious machinery for the prosecution of their business. They use from 150,000 to 200,000 pounds of sheet brass per year, from which the rough frame-work of the reed is punched; it is then planed and milled; the reed grooved and the tongue securely fastened in place by machinery; another machine letters the reeds, of which 15,000 are manufactured daily. The reed-boards are made of the best Michigan quartered pine. The places for the reeds are cut in the reed-boards by machinery. The product of this company goes all over the world. The export business amounts to \$100,000 per year.

**ENVELOPES.**—Envelopes were first used in England between 1830 and 1839, but only in a very limited way, as the use of an envelope called for double postage, the law then being that postage should be charged for the number of pieces of paper. This explains the custom, then prevailing, of folding the letter-sheet to make it answer the purpose of an envelope.

The Penny Post was established in 1840 by Sir Rowland Hill, and a demand for envelopes was at once created.

Up to this time, and for several years after, all the envelopes used were cut by hand; each stationer had blank patterns of several sizes of envelopes, and with the aid of a sharp penknife cut the blanks three or four at a time. On rainy days these blanks were folded and stuck together in the form of envelopes. There are to-day, in this country, stationers in business who in early life made in this way all the envelopes sold in their stores.

The first machine for making envelopes was invented in 1845 by Edwin Hill, a brother of Sir Rowland Hill, the father of penny postage.

Worcester has taken a foremost place in the development of the manufacture of machine-made envelopes. The third United States patent on a machine for making envelopes was issued to Dr. Russell L. Hawes, of this city, in 1853; the two preceding patents were upon machines of no practical value, so that it may fairly be said that the first successful machine in the United States for making envelopes was invented and patented by a Worcester man and built in the city of Worcester.

Dr. Hawes was then agent for Goddard & Rice, and saw in New York some hand-made envelopes, very likely made by a Pole named Karcheski, who is said to have made the first hand-made envelopes in this country.

Dr. Hawes thought he could make envelopes by machinery, and, returning to Worcester, built a machine in the shop of Goddard & Rice, which was subsequently patented. The blank for the envelope was first cut out by a die, then the sealing flap was gummed, the envelope blanks being spread out, one overlapping the other, and the gum applied with an ordinary brush. When the gum was dry the blanks were introduced into the folding-machine, which was a self-feeder, and in this Dr. Hawes applied the principle which is used on every successful envelope-machine in existence.

Up to this time all attempts at making envelopes by machinery had dealt only with the folding of the envelope, the blanks being fed to the machine by hand. Dr. Hawes went a step farther, and attached a feeding device to his folding-machine.

The blanks, having been cut and gummed on one edge, were fed to the machine in bunches of five hundred; gum was applied to the under side of the picker, which descended on top of the pile of blanks; the top blank adhered to the picker and by it was

lifted to the carriage, which conveyed it under the plunger by which the blank was forced into the folding-box. Small wings then folded over the flaps of the envelope and the gum by which the blank had been elevated to the carriage now performed a second office, that is, sticking the envelope together. The envelopes thus made by Dr. Hawes were sold to Jonathan Grout.

It required the services of one girl to attend the machine, while it took half the time of another girl to spread the gum on the sealing-flaps, so that three girls could produce a finished product of about twenty-five thousand envelopes in ten hours.

Thinking the machine had reached its maximum product, Dr. Hawes, who meantime had moved to the factory of T. K. Earle Manufacturing Company in Grafton Street, sold out, in 1857, to Hartshorn & Trumbull (Charles W. and George F. Hartshorn and Joseph Trumbull), who were succeeded in 1861 by Trumbull, Waters & Co. (Joseph Trumbull and Lucius Waters). In 1866 Hill, Devoe & Co. succeeded to the business. Mr. W. H. Hill is the present proprietor.

The principal improvements made in machinery have been in increasing the capacity, and with that, improving the quality of the manufacture, as the envelopes made on the old machines would not now be considered saleable.

At the present time one girl attending two machines can produce seventy thousand envelopes in ten hours. Mr. Hill owns the patent on his machines, they having been assigned to him by the inventor, in his employ, Mr. Abraham A. Rheutan, who has done much to contribute to improvements in envelope machinery.

The Reay machine is also used in this establishment. This is the invention of George H. Reay, of New York, and was patented in 1863. From one hundred and twenty-five to one hundred and fifty hands are employed in this factory.

The next Worcester man to make valuable improvements in envelope machinery was Mr. James G. Arnold, who, in 1858, devised a machine cutting the material for an envelope from a roll of paper, and also gummed and folded the envelope complete in one operation. He introduced into this machine the drying chain. By this invention, the gum, which theretofore had been applied to the sealing-flap with a brush, was applied to the envelope by the machine, and after the machine had folded the envelopes they were deposited in this drying chain, or endless belt with fingers, the envelopes being kept separate while the gum on the envelopes was drying.

This principle is a feature in nearly all envelope machinery of the present day, excepting the machines invented by D. W. & H. D. Swift.

While Mr. Arnold's machine was not a practical success, it had in it the foundation principles upon which the success of the self-gumming envelope-machine depends.

In 1864 G. Henry Whitcomb came into possession of the Arnold machines, and began the business of envelope-making in a small building in School Street, where the engine-house now stands. In 1865 he removed to the north corner of Main and Walnut Streets, where he remained till January, 1866, when he removed to Bigelow Court; he was then making one hundred thousand envelopes per day. This factory was the first building in the United States used exclusively for the manufacture of envelopes.

At that time Mr. David Whitcomb sold out his interest in the hardware store of Calvin Foster, and joined his son, the firm being G. Henry Whitcomb & Co.

In 1873 the business was moved into the present factory in Salisbury Street, additions to which were built in 1878 and in 1886. In 1884 the firm became a corporation, known as the Whitcomb Envelope Company. The machines used have been built on their own premises, and the patents upon them are owned by the company. The machines are the invention of Messrs. D. W. & H. D. Swift, who, in 1871, built one upon an entirely new principle, capable of making thirty-five thousand envelopes in ten hours.

In 1876 the Messrs. Swift invented their first self-gumming machine. A girl could run two of these machines, making seventy thousand envelopes in ten hours. The product was automatically registered, these being the only machines in the world with a clock attachment.

Besides the invention of four distinct envelope-machines, the Messrs. Swift have patented an automatic printing-press, for printing envelopes. The blanks are fed to the machines in three or four thousand lots, picked up singly by the air-feed, and carried into the press, where they receive the impression. They are then discharged on the opposite side of the machine and piled up, ready for the envelope folding-machine.

The construction of this press is very simple. It has a stop-motion attachment, and is so delicately adjusted that a single hair stretched across the attachment will spring the let-off motion and the press will stop. Seven presses, each capable of producing 30,000 impressions in ten hours, can be run by a man and girl, making a total of 200,000 impressions with only two operatives. The great efficiency of this machine will be appreciated when it is considered that 11,000 to 12,000 impressions is a large day's work for an operative on an ordinary job press.

One hundred and fifty hands are employed in the Whitcomb Envelope Factory. Their daily product is one million envelopes, with a capacity of double that amount.

To illustrate the efficiency of the Swift machine, owned by the Whitcomb Envelope Company, it can be said that Herman Schott, the largest envelope-maker in Germany; Alexander Pirie & Son, Aber-

deen, Scotland, the largest envelope-makers in the world; and Fenner & Appleton, of London, one of the largest envelope-makers in England, several years ago equipped their factories with the Swift machine.

The Logan, Swift & Brigham Envelope Company was incorporated February 1, 1884. Messrs. Logan, Swift & Brigham were for a long time associated with the Whitcomb Envelope Company. Their machinery is the invention of Messrs. D. W. & H. D. Swift, who have been mentioned in connection with the Whitcomb Company. Logan, Swift & Brigham employ one hundred hands.

Upon reviewing the history of these three companies, it is apparent that Worcester has been most prominently identified with the inception and development of machine-made envelopes. The most important contributions that have been made to this art have come from Dr. Hawes, Mr. Arnold, Mr. Rheutan and the Messrs. Swift, who have taken out upwards of twenty patents. The production of a single operative has been increased from less than 10,000 staple envelopes per day to 70,000.

In 1864 six males and sixty females were employed in the envelope business in Worcester. The capital invested was \$30,000.

To-day three millions of staple envelopes are made daily, which is between one-fourth and one-third of the entire product of the United States, and constant employment is given to four hundred operatives.

## CHAPTER CXC VII.

### WORCESTER—(Continued.)

#### MANUFACTURING AND MECHANICAL INDUSTRIES.

*Fire-Arms—Iron and Steel Business—Screws—Steam-Engines—Boilers.*

**FIRE-ARMS.**—Harding Slocumb, December 6, 1820, notifies his friends that he has established his business as gunsmith in Worcester, opposite Jeremiah Robinson's drug store, a few rods south of the Court-House, where he manufactures twist and straight rifles, fowling-pieces, and has musket-guns and pistol-flints for sale. These fire-arms were, of course, all made with the old flint-lock.

At this time Asa Waters (2d) had a gun-factory in Millbury, where he made government arms. Ware & Wheelock, at the top of Front Street, opposite the City Hall, in 1825, manufactured guns, and in 1833 Joseph S. Ware and John R. Morse were established in Main Street, where guns, rifles, fowling-pieces and muskets were made to order.

Ethan Allen is identified with this business from an early day up to the time of his death, and contributed very largely to improvements in methods and machinery. Mr. Allen was born in Bellingham, Mass., in 1810, where he received a common-school education,

His first mechanical employment was in a machine-shop in the town of Franklin.

In 1831 he was engaged in manufacturing shoe cutlery in Milford, and in 1832 moved to what was then known as New England Village, in the town of Grafton, where he commenced the manufacture of the Lambert Cane gun, in connection with shoe cutlery. This was the beginning of the fire-arms business which he prosecuted so successfully thereafter.

In 1833 he built a shop, which he occupied for some time for the manufacture of fire-arms and shoe-kit; this is still standing and used for manufacturing purposes. In 1834 Mr. Allen manufactured the saw-handle target rifle-pistol, and it is said that in 1835 he took one of these pistols to New York, and showed it to a Mr. Speis, who was engaged in selling fire-arms, and asked if there would be any demand for such an article. Mr. Speis looked at the pistol, and said: "Do you make these?" Mr. Allen replied "Yes." "What is your price?" Mr. Allen named it. "Why don't you ask twice as much?" was the reply; "I will take all you can make."

Thus encouraged, Mr. Allen returned to New England Village and began to make the pistols. Soon after he invented the self-cocking revolver, which was widely known at that period, and subsequently during the Mexican War and the California gold discoveries, during which time the business was most prosperous and profitable. As a gold-miner, Mark Twain "Roughing It," gives an amusing description of his experience with this self-cocking revolver, and the degree of skill in marksmanship which he had acquired by constant practice. "There was," he says, "no safe place in all the region round about." On one occasion he brought down a cow fifty yards to the left of the target, when an interested spectator persuaded him to purchase the carcass.

About 1837 Mr. Allen took into partnership his brother-in-law, Mr. Charles Thurber, who remained in business with him until 1856, when the firm was dissolved, Mr. Thurber retiring.

Early in the fifties he associated with himself another brother-in-law, Mr. T. P. Wheelock, who died in 1863, the firm being Allen & Wheelock. In 1842 the company moved to Norwich, Conn., where they carried on the manufacture of fire-arms. In 1847 they came to Worcester and located in Merrifield's building, where they remained until the great fire of 1854. Immediately after, they erected a shop at the Junction, now occupied by the L. D. Thayer Manufacturing Company and the Worcester Elevator Company, where the business was for some years prosecuted by them and their successors.

The removal from Norwich was the practical beginning of the fire-arms business in Worcester; since which time it has been a most important industry. Previous to that date there was nothing that could properly be called a manufactory; there were a few small shops, but nothing more.

In 1865, subsequent to the death of Mr. Wheelock, Mr. Allen took into partnership his two sons-in-law, Messrs. S. Forehand and H. C. Wadsworth, under the name of Ethan Allen & Company, and so continued until the death of Mr. Allen, January, 1871; after that, the business was continued by the surviving partners, under the firm name of Forehand & Wadsworth. Since 1883 the business has been prosecuted by Mr. Forehand alone, and since 1876 has been located in the Stone shop at the Junction, known as the Old Tainter Mill.

Mr. Allen was a mechanic and inventor of superior capacity. He invented a doubled-barreled breech-loading sporting gun, and was probably the first to use steel shells in connection with such an arm; these shells can be re-loaded indefinitely. He was the pioneer, in this country, in the manufacture of double barreled shot guns and fowling pieces.

Between 1855 and 1858 a change was made from the system of muzzle-loading to breech-loading fire-arms, although the breech-loading system had been adopted in Europe before that date, and, at the same time, the change was made from loose to fixed ammunition.

Allen & Wheelock were among the first to adopt the breech-loading system and to introduce the metallic cartridge.

Neither in this country nor in Europe had metallic cartridges been made except by hand—a slow and most tedious process. Mr. Allen recognized the necessity of making the metallic cartridges by machinery, and invented and patented the first set of machinery that was ever built for that purpose. The heading-machine, which is used by every manufacturer of metallic cartridges in the world, was his invention, and has stood the test of litigation. Prior to this, no one, so far as is known, had conceived of any process of forming the head except by spinning it up in a lathe.

At the Centennial Exhibition in 1876 the Government exhibited a set of this machinery, and there was nothing in the Mechanical Exhibition which attracted more attention. The whole process, from beginning to end, was the product of Mr. Allen's brain.

Probably no fire-arms manufacturer in the country made so great a variety of arms as he: from the whale bomb-lance to the cheap Fourth of July pistol, and every variety of fowling-piece.

Formerly all work was done with the file, cold chisel and anvil, but methods have greatly improved, until now there is no finer work done than what is popularly spoken of as "gun work." The parts are all interchangeable and made with the greatest nicety.

Charles Thurber, at one time associated with Mr. Allen, was a successful teacher in Worcester, and is credited with having invented the first type-writing machine, which is said to be still in existence.

Franklin Wesson, after his return from California,

Iver Johnson,

1859, began to manufacture fire-arms in Merrifield's building in Exchange Street. The first arm he manufactured was a single-shot breech-loading pocket pistol using a cartridge.

Mr. Wesson during the war manufactured twenty thousand stand of arms for the Government. At present he manufactures long range, short range, sporting rifles and pocket pistols.

Mr. Frank Copeland, 17 Hermon Street, established a manufactory for fire-arms in 1863; he was formerly in the employ of Allen & Wheelock, at their old shop at the Junction. He first manufactured revolvers, and in 1876 devised a single-shot breech-loading sporting gun, called "The Champion."

Mr. Copeland's second gun is a single-barreled sporting gun, called the "F. Copeland Gun," which is more strongly constructed, better in action and capable of standing heavier charges, and altogether more durable.

*Harrington & Richardson Arms Company.*—This business was established in 1871 by F. Wesson and G. H. Harrington, under the firm-name of Wesson & Harrington, for the purpose of manufacturing a shell-ejecting revolver, invented and patented by Mr. Harrington, and the business was located at 18 Manchester Street, in the building owned and used by Mr. Wesson as a rifle factory, a business in which he had been engaged for many years. This firm continued until 1874, when Mr. Wesson's interest was purchased by Mr. Harrington, who soon afterward formed a copartnership with William A. Richardson, under the firm-name of Harrington & Richardson, and the manufacture of the same style of revolver was continued. This revolver, which was the starting-point of the present business, was an improvement in convenience over any other then made, it being so constructed as to load and have the exploded shells removed by the sliding ejector, without detaching the cylinder or removing any portion of the arm; and it is believed to have been the first successful shell-ejector used on a metallic cartridge revolver. It had a large sale for a number of years. Various other styles of revolvers have been added, improvements made and patented from time to time. In the fall of 1876 the business was removed from Manchester Street to the more commodious quarters 31 Hermon Street. Here new and improved machinery and appliances were brought into operation, and have been constantly increased from year to year, and additional room occupied.

In 1880 Messrs. Harrington & Richardson became the sole licensees in the United States for the manufacture of the celebrated Anson & Deeley hammerless gun, an English invention. This was a high cost arm, ranging in price from eighty-five to three hundred dollars. The manufacture of this gun was continued for about five years. In January, 1888, Harrington & Richardson dissolved their copartnership, and reorganized as a stock company, with the follow-

ing officers: Gilbert H. Harrington, president; William A. Richardson, treasurer; George F. Brooks, secretary.

The business of the company is the manufacture of revolving fire-arms exclusively, which are produced of various styles and of different prices, from the plain, substantial, solid frame arm, from which the cylinder is removed by the withdrawal of the centre-pin upon which it revolves, to the more elaborate hinge-frame revolver, employing the automatic shell-ejecting system, by which all the exploded shells are thrown out automatically by the act of opening the arm for reloading.

All the arms manufactured by the company have a high reputation for quality, beauty of appearance and reliability. Very few persons not practically acquainted with this business have any idea of the amount and nicety of machinery and special tools and appliances required, and, where revolvers are produced in large numbers, of the care and close inspection necessary to maintain a high standard. If one would undertake to manufacture a new revolver of good quality and the average intricate construction, and were already provided with all the machinery that can be purchased of machine tool builders, adapted to this business, it would require a year to construct one small revolver, and make the tools and appliances necessary to produce the arm in quantities and of good quality.

Iver Johnson & Company, established in 1871, are located at 44 Central Street, and employ two hundred hands. Their products are air pistols, guns, revolvers and other arms; ice and roller skates.

January 30, 1856, notice is found of a new rifle invented by B. F. Joslyn, the manufacture of which was controlled by Mr. Eli Thayer. It was claimed to be superior to the Sharpe's rifle, both on account of the rapidity of its loading and the simplicity, safety and cheapness of its construction.

In March, 1859, the *Spy* said that Mr. Joslyn and Mr. Freeman, of New York, had purchased the large stone shop at South Worcester, where they expected to commence the manufacture of pistols under Joslyn's patent at an early day; and, in 1860, the War Department ordered from Mr. Joslyn one thousand of his rifles, which up to that time was the largest single order for fire-arms ever given to one contractor in the country. The Navy Department had previously ordered five hundred.

In April, 1861, they were busy day and night at the Lower Junction shop manufacturing Joslyn's breech-loading carbines for the War Department. Fort Sumter had then been fired upon and the demand for arms became pressing. All the iron-working establishments in the city were busy furnishing the Government with ordnance. Nathan Washburn was making five tons of rifle-barrel iron per day for the Springfield Armory, and was under contract to furnish one hundred thousand musket barrels.

Osgood Bradley was at work on gun-carriages and forges. Wood & Light were busy making machinery for the government at Springfield Armory. November, 1861, Shepard, Lathe & Co. were under contract for Colt, the Burnside factory and Springfield Armory. Allen & Wheelock had two hundred hands at work for the government and private parties. L. W. Pond was building twenty light rifle-cannon of his invention, called the "Ellsworth Gun," at the shop of Goddard, Rice & Co. This was a "breech-loading rifle-gun, four feet long, six inches in diameter at the breech and  $3\frac{1}{2}$  at the muzzle, with a  $1\frac{1}{2}$  inch bore, carrying a chilled conical ball weighing 18 ounces, which it will throw three miles. The gun weighs, carriages and all, 450 lbs. Cost, \$350."

July 11, 1862, a patent was granted to Theodore R. Timby, of Worcester, for improvements in a revolving battery-tower and improvements for discharging guns by electricity. Joslyn's breech-loading carbines were in high favor at this time with the government.

In 1862 Ball & Williams (in School Street) employed one hundred men in the manufacture of the Ballard rifle,—a cavalry rifle which they continued to make until the close of the war. This was a breech loading arm, using a .42 metallic cartridge, and the invention of Mr. Ballard, who had been a foreman for Ball & Williams.

December 29, 1862, the invention of Stevens' Platoon-gun, invented by W. X. Stevens, of Worcester, is noticed.

In April, 1863, Charles S. Coleman invents a breech-loading gun.

September 6, 1865, the Green Rifle Works was at the Junction shop.

January 15th, Ethan Allen & Co. were making from 20,000 to 50,000 cartridges per day.

**IRON AND STEEL BUSINESS.**—Nathan Washburn, at one time, worked for William A. Wheeler as a journeyman founder, and while in his employ invented a car-wheel, which he patented in 1852. In company with Mr. Converse, of his native town of Tolland, Conn., Mr. Washburn began the manufacture of these wheels in Franklin Street, next to Bradley's car-shop, and continued there until 1857, when the new building was erected near the freight depot of the Western Railroad, since occupied by Washburn Iron Company, and later by the Worcester Steel Works. The building, as designed, was to be occupied in part by Nathan Washburn as an iron-foundry for the manufacture of car-wheels; the main building was to contain machinery for re-rolling iron rails and for making locomotive tires, while the western end was to be occupied by Henry S. Washburn for a rolling-mill and a wire-factory. Meantime Mr. George W. Gill became associated with Nathan Washburn in the rail and tire business, and very likely suggested engaging in it; for he had been employed as foreman and contractor in charge

of the iron work upon the cars built in Mr. Bradley's shop, where Mr. Gill must have become more or less familiar with the railroad business. Previous to the introduction of the wrought-iron rail, rails were made of wood, with flat bar-iron on the upper surface; when the rails were loosened, the ends, called "snakes' heads," were often forced up through the car-bottoms, to the great discomfort and danger of the passengers. Mr. Gill was born in West Boylston, and learned the blacksmith trade in this city.

June 1, 1858, he retired from the partnership, but continued with Mr. Washburn as manager of the business.

In 1859 this business had reached considerable proportions, employing from one hundred and seventy to one hundred and ninety hands, and turning out forty tons of iron per day.

At this time, Mr. Washburn, in company with Canadian capitalists, established a rolling-mill at Toronto for re-rolling rails for the Grand Trunk Railway; he attended to the equipment of the mill, and three large steam-hammers were made for it by Wood, Light & Company.

In 1860 there was but one establishment in New England doing railroad work of this character, and that was located at South Boston. The Washburn car-wheel was very popular, and there was a good demand for re-rolling rails and for locomotive tires. Five hundred thousand dollars capital was employed in the business, and from two hundred and twenty to two hundred and forty men with a pay-roll amounting to seven thousand dollars per month. The works extended over four acres of ground. In the foundry, one hundred and seventy-five feet by sixty feet, forty car-wheels were cast each day and eight tons of machinery. In the rolling-mill, two hundred and fifty rails weighing forty tons were rolled daily, and also four tons of tire for driving-wheels, while seven puddling furnaces produced twenty tons daily of bar or puddled iron.

The trip-hammers for working over and welding together the worn-out rails were of large size, made by Wood, Light & Company, at their shop at the Junction, by whom the first set of gun-barrel rolls were made in 1860 for Mr. Washburn; these were modeled after an English set in the armory at Springfield.

In 1864 the Washburn Iron Company was formed, with Nathan Washburn, president, George W. Gill, manager, and Edward L. Davis, treasurer.

In 1864 Mr. Washburn went to Europe, and when he returned, brought with him an equipment for a small Bessemer plant of about one ton capacity, which he partially built but never completed. This must have been one of the earliest attempts in this country to erect a plant for the manufacture of Bessemer steel, as the first steel actually made was at Wyandotte, Mich., in the fall of 1864.

In 1865, Mr. Washburn sold out his interest to his

associates and built the works in Grafton Street, now occupied by the Washburn Car Wheel Company, where he continued the business of manufacturing car wheels until about 1866, when he sold out his wheel business to the Washburn Iron Company, and engaged in the manufacture of steel tire car wheels, and later started a foundry in Hartford to be run in connection with the Worcester shop. Mr. Washburn sold out his interest the same year altogether, but the business continued under the name of the Washburn Car Wheel Company, the product being locomotive truck and tender wheels.

Mr. Washburn then went to Allston, and remained until within two years, and is now engaged at South Boston perfecting a new solid cast Bessemer wheel. After leaving Allston, his plant was leased by Jonas S. Hart & Co.; it was burned down, later re-built, and is now occupied for the manufacture of wheels by Samuel D. Nye, under the firm-name of Jonas S. Hart & Co.

Mr. Nye has been connected with this business since 1859, having been associated with Mr. Washburn at that time and was with his successors in the business until the spring of 1888, when he resigned his position as manager of the Worcester Steel business and removed to Allston.

The Washburn Iron Company continued the business of re-rolling iron rails until 1881, when the demand almost entirely ceased by reason of the general adoption of the Bessemer steel rails, which resulted in a great saving in railroad construction. Iron rails were delivered in Boston in the summer of 1868 at eighty-eight dollars per ton of two thousand two hundred and forty pounds, while steel rails were delivered in Boston, November, 1888, at thirty dollars per gross ton.

In the winter of 1881 they began the importation of steel blooms, and in the spring of 1882 began rolling steel rails. Mr. Gill died April 13, 1882, and Mr. George M. Rice then acquired an interest in the business, which was managed by the Gill estate until October, 1883, when the entire property passed into the hands of Mr. Rice and his associates, who organized the Worcester Steel Works. The work of rolling steel blooms into rails continued until the fall of 1883, when work was begun upon the Bessemer steel plant, and the first steel was made in June, 1884. Later, an open hearth furnace was put in, and during the year 1888 two new trains of rolls have been added, modern heating furnaces, etc., for the manufacture of merchant bars.

About four hundred men are employed in these works, producing two hundred and thirty tons daily, made up of rails for steam and horse railroads, blooms, billets and shapes, merchant bars and castings. For over thirty years this business has had a prominent place among the industries of Worcester, being at one time the largest single industry in the city. It has followed the complete revolution of the rail business

consequent upon the introduction of Bessemer steel, and to-day stands equipped with all the modern appliances for the production of iron and steel. All this has followed from the invention of a car-wheel in 1852 by Nathan Washburn in the Wheeler foundry in Thomas Street.

SCREWS.—July 19, 1809, a patent was granted to Abel Stowell for cutting wood screws, but no screws appear to have been made in Worcester until 1831, when C. Read & Co. commenced the manufacture of wood screws at Northville, as has been stated in connection with the early history of the wire business. In April, 1836, mention is made of made of a machine for making wood screws, invented by C. Read & Co., "which will cut thirty gross of screws per day with one pair of dies, and one boy can attend from two to four machines, according to the length of the screw." The business is then spoken of as growing and flourishing, but the parties in interest became discouraged and the business was moved to Providence, and continued there for a time under the name of C. Read & Co., but finally came under the control of the company now and for many years known as the American Screw Company. Since that time no wood screws have been made in Worcester.

*Worcester Machine Screw Company.*—Mr. A. W. Gifford, who, when a boy, was apprenticed to parties in Providence, in 1853-54 engaged in making wood screws, and later was employed in Worcester by Allen & Wheelock in their fire-arms business, and by Ball & Williams in making the Ballard rifle for the Government, in 1866 received from the Worcester Mechanics' Association a testimonial for a case of milled machine screws, which were the first made for the market in the city or county, and probably in the State. The Worcester Machine Screw Company started in a very small way, with a few machines of their own manufacture, made after some of Mr. Gifford's designs. Originally, it was a co-partnership between A. W. Gifford and E. A. Bagley, but later Mr. Gifford became and has continued to be the sole proprietor. The business has grown, many changes have been made in the machinery, and important processes introduced, so that this company is to-day able to compete with any concern in the country in this line of business, in which everything depends upon accuracy and efficiency in the tools, machines and fixtures.

The machine used in the screw business prior to 1866 was what was known as the turret-head machine, used by gunsmiths, sewing-machine makers, and at the Springfield Armory. This was not well adapted to the class of work required of it. Mr. Gifford was the inventor of the machine used by himself and others which superseded it, and which has remained in use till the introduction of newer machinery. The old turret-head machine consisted of a revolving traverse spindle, with a dial for holding a series of tools. That, in turn, was succeeded by a machine in-

vented and patented by Mr. Gifford September 28, 1875, and improved December 26, 1876, in which the blanks are cut automatically to the length required for the screw and fed into the machine, which is so arranged that they are simultaneously milled, threaded and pointed.

The product of this factory now goes to all parts of the country. From eighty to one hundred hands are employed, and some four hundred tons of iron and steel used per annum; the factory is located at 75 Beacon Street, a brick building, two hundred and fifty by thirty-six, two stories high, with a basement under the main building, with a wing forty by thirty-six for office and packing room. The steam-power is furnished by a one hundred horse-power boiler, and an eighty horse-power Corliss engine. Besides his improvements and patents on screw machinery, Mr. Gifford has taken out patents on small hardware articles, such as tweezers, cutlery, etc.

McCloud, Crane & Minter, manufacturers of machine screws, are located at 57 Union Street. The business was purchased in 1872 of James H. Gray, who in 1870 had bought a patent of Bagley's. Meantime, in March, 1869, Mr. Minter started the same business and continued up to 1884, when he consolidated with McCloud & Crane, and the firm became McCloud, Crane & Minter. Their business is milled machine work, standard and machine screws, studs for steam-engines, pumps, etc., and machinists' taps, to which they have recently added finished and case-hardened nuts. Improvements have been made from time to time in the machinery, and their capacity has been increased, but the advance has been for the most part in the direction of turning out an increased quantity from a given number of machines, and in the department of thread-cutting. Beginning with twelve hands, they now employ forty-four. Their iron is purchased in the square, round and hexagon, and also in the shape of wire drawn to size.

A. A. Bedard & Co., 89 Exchange Street, are also engaged in this business.

**STEAM-ENGINES.**—The mills in Worcester depended almost exclusively on water or horse-power until 1840. Mr. Wm. A. Wheeler is said to have had a steam-engine of some sort to run a fan in his foundry prior to his removal to Brookfield, and upon his return to Worcester, in 1831 or 1832, he abandoned this engine and substituted horse-power, which he used until 1840, when he put in another engine.

Howe & Goddard, at the Red Mills, had an engine of some kind in 1836.

Mr. Wheeler is credited in Bishop's "History of American Manufactures," with having the first steam-engine employed in the State west of Boston.

In 1840 Mr. Merrifield put in an engine of from four to six horse-power, opposite the location of his present office; and probably the first efficient steam-engines in Worcester were put in at this time by both Mr. Merrifield and Mr. Wheeler.

The demand for power at this time was larger than the supply, so that an engine purchased one year was discarded the next for a larger one. Between 1840 and 1850 Mr. Merrifield put in five engines. The last one, put in in 1854, is still running.

Steam-engines were not manufactured in Worcester to any extent until 1864. Mr. Wm. A. Wheeler made an engine in 1842 for Wm. T. Merrifield.

Jerome Wheelock, at one time engineer of the Washburn Iron Works in this city, commenced his business career by making and introducing the sectional ring and piston packing, patented in 1864, and afterwards extensively used in every type and make of engine. Meeting with marked success, he completed, in 1865, arrangements for its manufacture with William A. Wheeler, of Worcester. The demand soon became such that he left the Washburn Iron Company, to give his entire attention to the packing business. In the fall of 1865, or spring of 1866, he formed a partnership with Charles A. Wheeler.

This led to a considerable repair business, and that in turn led to the invention by Mr. Wheelock of several improvements in steam-engines. In the fall of 1869, the first engine embodying these improvements was built; this proved to be the beginning of a considerable business. The earlier engines of this type were constructed with a single rotary valve, which proved imperfect in many respects, but contained the germ of success. The growth of the packing business and the prospect of engine-building occasioned the removal to 178 Union Street in 1869, where the business has since been continued.

Step by step the Wheelock engine has been improved, until in 1873, at the American Exhibition in New York, the four-valve engine was introduced to the public. This employed the rotary tapered valve, suspended on hardened steel spindles—a new type of valve, which has become widely known and used. Mr. Wheelock has invented and patented numerous improvements relating to the steam-engine, such as feed-water heaters, condensers, and various details of the Wheelock engine.

The building of these specialties, together with the piston-packing and a large increase in the engine business, required successive enlargements, until the two floors of the present location were occupied, and a force of from fifty to seventy-five men employed. During the interval from 1873 to 1884 a great number of engines were built, including a large proportion of machines of five hundred horse-power. In 1883 and 1884 the most important of Mr. Wheelock's inventions was being developed and tested, the patents upon which were issued in 1885. This was the so-called new system valves, undoubtedly the most original and important departure in engine construction since the invention of Corliss. This well-known valve system has for its main idea the combining of the valve, valve-seat and operating parts within a shell or tapered plug which is driven into a corresponding hole

Jerome Wheelock

in the cylinder and retained in place without bonnets or bolts. It also employs an entirely novel method of driving the valve, and combines a number of improvements securing economical results in the use of steam.

Patents were taken out in all the larger manufacturing countries of the world, and much of Mr. Wheelock's time during the years 1886 and 1887 was spent abroad negotiating for the manufacture of the new system engine. His success was such that at the present time it is being extensively built in all these countries. During his absence his home business so greatly declined that in the latter part of 1887 he decided to offer it for sale, which resulted in its purchase by a company organized for the purpose of carrying on the building of the new system engines. The "Wheelock Engine Company" took possession in January, 1888. It is rapidly increasing the business and improving the facilities to meet the demand for the improved engine. New works will be built, new equipment added and other facilities provided.

The Wheelock engine is generally acknowledged to contain some of the best principles of engine construction at present known. Great credit is due to Mr. Wheelock for his inventions, which for originality and importance have been hardly exceeded. His principle of construction bids fair to gain as wide adoption as did that introduced by George H. Corliss forty years ago. It is being applied to marine engines, in which field its opportunities are enormous, and its success already demonstrated.

E. H. Bellows commenced engine-building in August, 1864, renting a shop in Merrifield's building, in Exchange Street. His specialty was portable engines, ranging from the smallest up to forty horse-power. He also built some small stationary engines, not exceeding fifteen to twenty horse-power.

In 1865 Byron Whitcomb became a partner in the business, the firm-name being Bellows & Whitcomb. The same line of manufacture was continued until 1868, when the firm was dissolved.

The Washburn Steam Works were incorporated in 1867, with George I. Washburn, president. The object of the company was to build a novel, high-speed, valveless steam-engine, the invention of Mr. Washburn. The chief peculiarity of the engine and the essence of the invention was in so arranging the pistons of a pair of cylinders that each acted as a valve to the other, performing the functions of inlet and outlet of steam, thus doing away with valves. Its arrangement was upright, with twin cylinders, each having several pistons on one piston-rod. The movement of these compound pistons, passing over and by suitable ports connecting the cylinders, produced the requisite opening and closing for the admission and release of the steam. The stroke of these engines was proportionally very short, and the rotative speed consequently great, which features, in connection with the other mechanical objections, proved fatal to the success of this ingenious invention.

The business was commenced in 1865, in a small up-stairs shop in one of the blocks in Main Street, between Park and Southbridge Streets. In the spring of 1869 the works were removed to the Wheeler building, Hermon Street, and again, in the spring of 1871, to Central Street.

The defects of the engines soon becoming apparent, Mr. Washburn turned his attention in another direction, the outcome of which was the Washburn Steam Pump, embodying some of the principles of the engine. The manufacture of this pump was begun in the fall of 1868, and continued with success for a number of years. A serious interruption in the business resulted from the death of Mr. Washburn, in the spring of 1871. In 1872, A. Burlingame, for four years previous foreman of the Washburn Steam Works, bought the business and continued the manufacture of the Washburn Steam Pumps on a considerable scale.

A. Burlingame became connected with the Washburn Steam Works as foreman of the shop in 1868. He bought the business in 1872, continuing under the well-established name of the Washburn Steam Works, and made a specialty of the Washburn Steam Pumps until, 1880, the change to the present firm-name, A. Burlingame & Company, was made. About this time the attention of the firm was turned to steam-engines as a supplement to the pump business, which was suffering from the competition of the injector as a boiler feeder. From a general repair business they gradually went into building plain slide-valve engines up to fifty horse-power, followed by an improved pattern balanced slide-valve engine, and later by a Corliss type engine, each of which is now built by this firm in a full line of sizes up to one hundred horse-power. Additional to engine building is the making of boiler feed-pumps, and the fitting of complete steam plants, beside a large general mill-work and repair business. The location of the Washburn Steam Works, in Central Street, was abandoned by Mr. Burlingame in 1869, when he moved to School Street, remaining in that place until 1883. During this year, 1888, he moved to the present location in Cypress Street.

S. E. Harthan began the manufacture of stationary, semi-portable and launch engines on a small scale at 44 Central Street, in the year 1874.

Increasing business up to 1878-79 required the employment of from twenty to forty men, engaged mostly in building engines of small power of the types mentioned. In 1882 he sold to the Glen Rock Manufacturing Company, of Glen Rock, Pa., that portion of the business relating to stationary and semi-portable engines, including patterns; after which he gave his whole attention to building yacht and launch engines, high and low pressure and compound, together with complete steam outfits. Becoming engaged in electric work, the engine building has been gradually abandoned until at the present

time he is practically out of the business, engaging in it only to the extent of building an occasional engine for electric purposes.

Besides many stationary engines, he has built the steam machinery for about fifty-three yachts and launches, amongst which was a very fine private yacht for Jacob Lorillard, another for Mary Anderson, and one for Chauncy Ives, of New York, as well as seven smaller boats for Lake Quinsigamond, Worcester.

Clark & Knight established the business of engine-building in 1877. They manufactured upright engines up to thirty horse-power. The business is now conducted by E. O. Knight.<sup>1</sup>

Mr. Frank Copeland, gunmaker, 17 Hermon Street, makes small vertical steam-engines from one to twenty horse-power.

**BOILERS.**—The Stewart Boiler Works were established in 1864 as Stewart & Dillon. Mr. Charles Stewart learned his trade in Hull, England. He came to Worcester first to manufacture boilers for Bellows & Whitcomb, who were building engines.

In 1869, C. Stewart succeeded to the business, and prior to 1872 had purchased the boiler business of Rice, Barton & Fales.

Mr. Stewart and William Allen were in partnership from 1872 to 1875, when they dissolved. The business has since been conducted by Charles Stewart and C. Stewart & Son. Their castings are all made in the city, and their boiler-plate from American steel. They manufacture locomotive and stationary boilers.

William Allen & Sons were established in 1875, after the dissolution of the partnership between Stewart & Allen. They were first situated in South-bridge Street, near the Junction, and in 1823 removed to their present location in Green Street, in the old shops of the New York Steam-Engine Company.

They manufacture all classes of steam-boilers,—tubular, locomotive and marine boilers, feed-water heaters, bleaching kiers, dye-well extractors and iron tanks of all kinds; iron cases for water-wheels and boilers for residences; have an iron and brass-foundry, and make their own castings. They occupy a substantial brick two-story building, a boiler-shop and foundry, and occupy sixty thousand feet of land.

Mr. William Allen is an Englishman, and served his apprenticeship at the works of James Watt, Birmingham, England.

<sup>1</sup> I am indebted to Mr. E. K. Hill for much of the material used in the article on steam-engines.

C. G. W.

## CHAPTER CXCVIII.

### WORCESTER—(*Continued.*)

#### MANUFACTURING AND MECHANICAL INDUSTRIES.

*Boots and Shoes—Bigelow Heeling-Machine—Leather Belting—Boot and Shoe Machinery—Lasts—Dies.*

**BOOTS AND SHOES.**—From Caleb A. Wall's Reminiscences we learn that Captain Palmer Goulding, a cordwainer, came to Worcester just previous to the first organization of the town, and built a house on the east of the Common, where his son Palmer, Jr., and grandson Daniel afterwards lived. They also carried on the business of tanning, shoe-making, making malt, curing hams, etc. Their place of business was in front of their dwelling, and occupied ground between, what are now Front, Mechanic, Church and Spring Streets.

Almost every town had a tanyard, and leather of sufficiently good quality was made to serve the needs of the shoemakers and saddlers.

The embargo and War of 1812 greatly stimulated the cordwainers, who began to make boots and shoes in quantities in anticipation of the wants of their customers, and when a few dozen pairs had accumulated, they were put in saddle-bags and taken to market, principally Bristol, R. I., the first wholesale boot and shoe market in the country, it being a sea-port town.

At this time the bottoms of all boots and shoes were sewed on; putting them on with pegs was an invention of a later date, and very greatly reduced the cost; this improvement aided materially in the development of the industry. Among the first to adopt it was Joseph Walker, of Hopkinton, Mass.

The next step in the development of the boot and shoe industry was for the makers of leather to sell it to merchants in the larger towns and cities, who, in turn, sold to the shoemakers, and they, in course of time, paid for it out of the product, in boots and shoes, which were sold by the leather dealers to the jobbers in Bristol, Providence, Boston and New York. These cities held the trade for many years.

The next step in the development was the separation of the leather business from boot and shoe manufacturing, the firms dealing in the leather requiring money payment for leather and the boot and shoe manufacturers selling their product to firms dealing in boots and shoes only, who, in turn, sold them, usually by the case of sixty pairs of shoes and twelve pair of boots, to country store-keepers, who from that time have kept them in stock as universally as dry-goods or groceries.

Among the first towns in which this business was begun was Hopkinton; then in the adjoining town of Milford; and about the same time in several other eastern towns; shortly afterwards in Grafton, where Oliver Ward learned his trade of Clark Brown. Mr. Ward started in business in North Brookfield in 1810,

*J. H. Walker.*

and from the history of North Brookfield we learn that "he made his own pegs; maple logs were sawed in sections of the proper length, which were then split with a long knife and the splint divided into pegs. The next improvement was to cut the points of the pegs in the blocks with a knife and mallet before splitting; and the next was to cut the points with the tail gouge driven like a carpenter's plane; and the next to do the whole by machinery."

Tyler Batcheller, of Brookfield, also learned the shoemaker's trade in Grafton, and, returning to Brookfield, commenced business in 1819, with his brother Ezra, who learned his trade of Oliver Ward.

Worcester was more than a quarter of a century behind these towns in the boot and shoe business, but has to-day an important place in this industry.

Previous to 1813 the only man engaged in boot and shoemaking in Worcester was John Tyler Hubbard, whose shop was on Front Street, corner of Spring.

He would hardly be called a manufacturer at the present day, as he did business in a very small way, and, when he had accumulated a few dozen pairs, would take them to Bristol, R. I., for sale.

In 1813 John Dolliver and Foster Newell made for the market ladies' morocco and kid shoes opposite the Court-House.

In February, 1818, Earle & Chase had a quantity of goat-skin leather dressed in the manner of black kid, which they were having manufactured into shoes and boots.

In 1824 Benjamin B. Otis commenced business near the harness shop of Enos Tucker, and continued until 1850, part of the time with John C. Otis, as B. B. Otis & Co. In 1850 C. H. Fitch became a partner, the firm-name being Otis, Fitch & Co. The same year B. B. Otis retired, and a new firm was organized of Fitch & Otis, which continued until 1860. For three years from 1863 the firm was Dike & Fitch, and from that time until 1886 the business was conducted under the name of C. H. Fitch & Co.

In 1828 Scott & Smith were manufacturing ladies' shoes of various kinds, nearly opposite the Central meeting-house, at the sign of "The Golden Slipper," where they made ladies' kid and double prunella walking shoes and pumps.

In 1834 Charles Wolcott and Nathaniel Stone had a shop three doors south of the Centre School-house, under the *Ægis* printing-office, where they manufactured boots and shoes, also ladies' kid, morocco and satin shoes. In the same year Thomas Howe & Co., at the head of Front Street, advertised for eight or ten journeymen to make bootees for the Military Academy at West Point.

Barnard & Hager were at the same time making goods on Front Street, corner of Summer.

In 1835 T. S. Stone began to manufacture in Washington Square, and in that year and the year following, he took a premium for his boots at the Cattle Show.

In 1839 he admitted as a partner, Ansel Lakin, who was with him but a short time. Mr. Stone continued with various partners until 1864, when Samuel Brown became associated with him. In 1868 A. G. Walker entered the firm, and the business was conducted under the name of Stone, Walker & Brown. In 1871 the firm was again changed, Messrs. Brown and Walker retiring and Mr. Stone's sons being admitted. The business was continued until Mr. Stone's death, in 1873.

George and Ebenezer H. Bowen came from Leicester, and commenced the currying of leather, as early as 1836, from which time for twenty years, they were in addition, directly and indirectly connected with the manufacture of boots and shoes.

In 1837 Ansel Lakin began in a small way in the village of Tatnuck, and was afterwards in partnership with Timothy S. Stone. In 1841 he was doing business with Bemis & Williams, and after this he continued with various partners for nearly twenty years.

In 1838 Wm. A. Draper came from Spencer and started in business in Pleasant Street. In 1842 Otis Corbet was admitted to the firm and they continued until 1847, when Mr. Draper went out and the business was conducted by Mr. Corbet alone. In 1850 Mr. Draper returned, and for two years the firm was Wm. A. Draper & Co.

In 1842 E. H. Bowen and William Barker began to manufacture as E. H. Bowen & Co. Barker retired in 1844, and Bowen formed a partnership with T. S. Stone, under the firm-name of Bowen & Stone, which was dissolved in 1848. After this, Bowen continued alone until 1857.

In 1843 Joseph Walker came to Worcester from Hopkinton, and began business in a wooden building in Front Street. In 1844 the firm of Barker & Walker was formed, occupying a building at the corner of Main Street and Lincoln Square. Mr. Barker retired from the firm in 1846. Joseph Walker continued alone until 1851, when his eldest son, J. H., being of age, was admitted, and the firm-name was Joseph Walker & Co., their place of business being at Lincoln Square. G. M. and A. C. Walker, two other sons, were admitted to partnership on their becoming of age. In 1862 this firm dissolved, J. Walker and his son, A. C. Walker, continuing under the old name until 1871.

In 1845 Cyrus, William R. and George W. Bliss moved their business from Milford to Worcester, and continued until 1853. George W. Bliss then succeeded to the business and moved into the Merrifield Building in Union Street, retiring in 1857.

Levi A. Dowley was at this time manufacturing brogan shoes in a small way.

In 1846, on the dissolution of the partnership of Barker & Walker, Wm. Barker commenced business on his own account, and was alone until 1850, when Courtland Newton was admitted, remaining in the firm till 1853. In 1857 Newton Penniman was

admitted. Mr. Barker afterwards continued for several years alone.

In 1847 J. Munyan was manufacturing shoes in Main Street, and continued until 1850.

In 1849 Rufus Wesson, Jr., came to Worcester from Shrewsbury, and was in business in Harding's Block, 45 Front Street, until 1873. His son, J. E. Wesson, began alone in 1868, and is now doing a large business in Mulberry Street.

In 1851 W. A. S. Smythe commenced the manufacture of shoes at the corner of Union and Market Streets. In 1860 his brother, Robert L. Smythe, joined him. They gave up manufacturing in 1872, being then situated in Foster Street.

In 1852 Hiram French succeeded to the business of Wm. A. Corbet, and continued the manufacture of boots until 1871.

In 1853 Aaron G. Walker commenced manufacturing, and continued alone until 1857, when he went into company with E. N. Childs.

In 1853 C. C. Houghton began the manufacture of boots at Lincoln Square. In 1857 he admitted his brother, Alba Houghton, into the partnership of C. C. Houghton & Co., and continued with him until 1864, when Alba Houghton retired. In 1864 the partnership of Houghton & Heywood was formed and was dissolved in 1867. H. B. Adams was then admitted, and the firm of Houghton & Adams continued for one year.

Mr. Houghton was alone until 1871, when Wm. Warren became a partner, the firm-name being C. C. Houghton & Co. Mr. Warren retired in 1884. At present the firm consists of C. C. Houghton, F. N. Houghton and E. W. Warren, and is known as C. C. Houghton & Co., which is situated in Houghton's Block, corner of Front St. and Salem Square.

In 1853 E. N. Childs came to Worcester from Millbury, and engaged in business with Albert Gould for one year. In 1854 Albert S. Brown became a partner. They did business as Childs & Brown until 1857, when Mr. Brown retired, and A. G. Walker was admitted into the firm of E. N. Childs & Co. In 1862 Mr. Walker retired, and Mr. Childs continued under the same firm-name until 1881. During the last few years his sons were interested with him in the business.

In 1855 Luther Stowe came to Worcester from Grafton and commenced business in Mechanic Street, soon after which he formed a partnership with E. A. Muzzy, as E. A. Muzzy & Co. The firm dissolved in 1865. Mr. Stowe and Mr. J. F. Davenport, under the title of L. Stowe & Co., commenced business in Washington Square. In 1875 Mr. Davenport retired, and the business was continued under the firm-name of Luther Stowe & Co. In 1880 they moved to a factory in Grafton Street, and still continue there under the old firm-name, Mr. Stowe's son now being a partner.

In 1857 David Cummings began with Mr. Hudson, the firm-name being Cummings & Hudson. Mr.

Hudson retired in 1862, and Mr. Cummings continued alone until 1866, when he left Worcester. He returned in 1880, and with his partners, E. H. Hurlbert and D. E. Spencer, built and occupied the factory in King Street, now occupied by them.

E. A. Muzzy and Luther Stowe commenced manufacturing, in 1857, as E. A. Muzzy & Co., continuing until 1865, when Mr. Stowe went out and Mr. Muzzy retired from manufacturing, the business being continued by G. L. Battelle and F. A. Muzzy, under the old name of E. A. Muzzy & Co., until 1875.

In 1860 H. B. Jenks came to Worcester from North Brookfield, and commenced the manufacture of boots and shoes, continuing until 1871.

Also, in 1860, H. B. Fay came to Worcester from Shrewsbury. He continued to manufacture until 1887, most of the time under the firm-name of H. B. Fay & Co.

In 1862 J. H. Walker commenced business in Eaton Place. In 1864 George M. Walker was admitted, the firm-name being changed to J. H. & G. M. Walker. They afterwards built a factory in Front Street and one in Eaton Place. In 1870 they built and moved to a factory in Water Street, the capacity of which was doubled in 1879. G. M. Walker retired in 1870. Samuel Davenport took his place, and in 1880 H. Y. Simpson was also admitted, the firm-name always remaining J. H. & G. M. Walker. The specialty of this firm was the widely-known "Walker boot." They retired from business January, 1888.

In 1863 J. W. Brigham & Co., who had been manufacturing for three or four years in a small building near the junction of Main and Southbridge Streets, built and moved into the factory in Southbridge Street, where they now are.

In 1864 Bigelow & Trask commenced the manufacture of shoes in Austin Street. In 1866 they were incorporated under the name of the Bay State Shoe and Leather Company, and have been doing business under that name ever since at the same place. The headquarters of this corporation is in New York, J. Munyan, before referred to as manufacturing in 1847, is vice-president and Worcester agent.

In 1865 E. H. and O. N. Stark formed a partnership under the name of E. H. Stark & Co., and have continued without change, and are at the present time located in Main Street, above Myrtle.

In 1866 Simon J. Woodbury, of Sutton, moved a building from that place to the site of the shop now occupied by Goddard, Fay & Stone, and he, with others, manufactured for a short time. In 1866 Rawson & Linnell moved their business from West Boylston to Worcester, bringing with them twenty-two families and commenced manufacturing in Pleasant Street, near Main, under the name of E. C. Linnell & Co. In 1868 they built a factory on the site of the Woodbury building in Austin Street. Mr. Linnell withdrew in 1869, and a new firm was organized under the name of D. G. Rawson & Co., consisting of D. G.

*Saml R. Heywood.*

Rawson, D. S. Goddard, W. B. Fay, which continued until 1881.

In 1867 Alba Houghton withdrew from the firm of C. C. Houghton & Co. and commenced business on his own account under the name of Alba Houghton & Co. and continued until 1882. In 1867, on the dissolution of the firm of Houghton & Heywood, S. R. Heywood went into business for himself and was alone until 1873, when Oscar Phillips was admitted as a partner, and business was done under the firm-name of S. R. Heywood & Co. In 1880 they moved to their new factory in Winter Street, and in 1884 were incorporated under the name of the Heywood Boot and Shoe Company. The specialty of this corporation is the widely-known "Wachusett Boot," and fine sewed shoes.

In 1871, A. G. Walker and Samuel Brown withdrew from the firm of Stone, Walker & Brown, and, commencing under the name of Walker & Brown, continued until 1879, when Mr. Walker retired. Mr. Brown went on alone under the same firm-name, and is at present doing business as Walker & Brown, in Barton Place, his son being a partner.

In 1871, Whitcomb, Dadmun & Stowe commenced in Southbridge Street, and continued for four years, when the firm dissolved, and C. C. & C. H. Whitcomb formed a new partnership, under the name of Whitcomb Brothers, and were manufacturing for nine years, when the firm was again dissolved. They were succeeded by C. C. Whitcomb and E. B. Miles, under the name of Whitcomb & Miles, who are now manufacturing in Shrewsbury Street.

In 1872, H. B. Adams, H. W. Hastings and A. C. Walker, began business in the block corner of Allen Court, second story, and then moved to Cherry Street, and, under the name of Adams & Hastings, continued until 1878.

In 1875, J. F. Davenport left the firm of L. Stowe & Co., and he, with Alfred W. Long, started in Eaton Place as Davenport & Long, continuing until 1885.

In 1875, G. L. Battelle, under the name of G. L. Battelle & Co., succeeded E. A. Muzzy & Co., and engaged in the manufacture of a cloth-boot, called "Alaskas," and custom boots and shoes. He is situated in Mechanic Street.

In 1878, J. U. Green, coming from Spencer, began business in Cherry Street, under the name of J. U. Green & Co., afterwards moving to Front Street, where he continued in business until 1883.

In 1881, upon the dissolution of the partnership of D. G. Rawson & Co., C. S. Goddard, W. B. Fay and A. M. Stone, formed a new company, under the name of Goddard, Fay & Stone, and continued in business until January 1, 1889, when they were succeeded by Goddard, Stone & Co. They have always occupied the factory where they are now located in Austin Street, the capacity of which was doubled by them in 1886.

In 1883, Bemis & Fletcher began business in Me-

chanic Street, under the name of the Waverly Shoe Company, and are at present located in Front Street. Their specialty is the "Waverly School Shoe."

In 1888, F. W. Blacker, who was with the firm of J. H. & G. M. Walker from 1865 until their retirement, succeeded to the business, leasing the old Walker factory, in Eaton Place, with its machinery, tools and patterns, and continues to make the widely-celebrated "Walker Boot."

Until the year 1868 nearly all the boots and shoes manufactured in Worcester were hand-made, machinery, excepting the sewing-machine, being little used.

Worcester manufacturers were always slow in adopting boot and shoe machinery, and they did not use it until long after it had been adopted in other places. From 1850 to 1868 a large proportion of the boots and shoes were taken to the adjoining towns of West Boylston, Oakdale, Holden, Grafton, Millbury and Auburn to have the bottom stock put on; and then they were brought back and finished in the factories in Worcester.

Since 1868 the quantity thus bottomed has steadily decreased. There was at one time a great prejudice among consumers against goods made by machinery hand-made work being considered far superior, and for the first few years after the introduction of the pegging-machine, it was absolutely necessary that the manufacturer "sand off" from the bottom of every boot the impressions made by the machine, for fear the boots might be rejected by the customer. To such an extent was this feeling carried, that as late as 1870 large quantities of goods were sold stamped "Warranted Hand-made," on which nearly the whole work was done by machinery.

There is probably no industry where the improvement in manufacturing has been so radical and complete as in this. The only department where there has not been a great improvement is in that of the upper leather cutting and treeing. The cutting of upper leather is done by hand, and probably always will be. Treeing is done substantially as it was when boots were first made, and, although machines have been invented for doing this work, they have never been considered satisfactory.

By the use of machinery in its present perfected state, goods can be produced that are more uniform than any that can be made by hand. A striking feature in the manufacture of boots and shoes is the division of labor. As far back as 1840 all who called themselves shoemakers were able to take leather in the side and complete a perfect boot or shoe. In these days, in the large factories an ordinary boot will go through the hands of fifty or sixty different persons, the work in each room being minutely divided, and few of the men being skilled in any but their particular part. This is one reason why boots and shoes are produced and sold so cheaply at the present time. Each man takes up that branch to which he is best

adapted, and continual practice makes him an adept. The cost of labor on a case of twelve pairs of ordinary heavy boots, at the present time, is about five dollars. To produce the same number of boots by hand, by old methods, would take the wages of two weeks.

The making of lasts, patterns and dies now used, has been so far reduced to a science that one can go into a first-class boot and shoe store and procure boots or shoes that will fit him perfectly.

Worcester is practically what is called a boot town, comparatively few shoes being made, and the only factories to-day that devote themselves exclusively to the manufacture of women's, misses' and children's shoes are those of J. E. Wesson and the Waverly Shoe Company, which are now making what is called "Medium Grade" and "Weight Shoes."

Heavy shoes, called "brogans," and plow-shoes are made, but these are considered about the same as boots, and are usually made in the same factories by the same workmen. Efforts have been made by various manufacturers to introduce men's fine shoes, which have partially succeeded, though not sufficiently to allow of Worcester being classed as a shoe town.

In treating of the boot and shoe industry, it is not generally understood that the manufacture of boots and shoes is distinct. A workman is seldom found who can do equally well on each kind of work. The manufacture of ladies' fine shoes, such as are made in Haverhill and Lynn, has never been attempted here. In order to do this it would be necessary to obtain the help from those towns, and this has always been found unsatisfactory. Many attempts to make boots in shoe towns have failed, and the fact is fully recognized.

The manufacture of boots and shoes is now, and has been for years, one of the leading industries of Worcester, and has been uniformly successful. This is not due to the manufacturers alone. In most of the large boot and shoe towns the workmen are the unsettled population. In Worcester it is not so. Nearly all are permanent residents, a large number owning their homes, and, even in times of great business depression, few leave the city. To this fact must be largely attributed the absence of strikes. While other places have been visited with labor troubles, but two strikes of any consequence have been known here, one in 1867 and one in 1887.

It is to the credit of employer and employes that they have considered their interests mutual, thus enabling the differences between them to be readily and satisfactorily adjusted.

It is worthy of notice that, with scarcely an exception, none of the present or past manufacturers of Worcester have had any educational advantages superior to those of the common school. They nearly all learned their trade at the bench, and to this, in a great measure, must be attributed their success.

Being able to do any part of the work themselves, they are competent to judge if the work is properly done by others. They have proved themselves to be enterprising and worthy citizens, and have held a full share of the honorable positions in the gift of their fellow-townsmen. They have been represented in the directories of the various banks, in the Common Council, Board of Aldermen, State Legislature, and will be represented in the Fifty-first United States Congress.<sup>1</sup>

**THE BIGELOW HEELING-MACHINE.**—This machine is an improvement upon the McKay machine, with which its interests are now identified. Mr. H. H. Bigelow patented the heel in 1869, and the machine in 1870.

The advantages conferred by this machine are manifold. By means of it all the odd or "V"-shaped pieces of sole leather, which were formerly considered worthless, are utilized. These are joined or fitted closely together, under a solid upper lift, and fed to the machine, which consists of a revolving cylinder, making one revolution in four motions. First, the heel is pressed; then, a quarter revolution and the heel is pricked for the nails; then, another quarter revolution and the nails are driven; with the final quarter revolution the completed heel is forced from the cylinder.

The machine not only utilizes pieces of leather of every kind and shape, but takes all heels, whether whole, half or quarter lifts, and saves one good lift on each boot or shoe heel, since the leather which would otherwise be trimmed off is, by reason of the equal pressure upon the heel from all sides, evenly and smoothly forced into the heel, elevating it, and making a difference of one entire lift in height. A good lift is worth about two cents.

The machine not only makes pieced heels, but all styles, heights, shapes and sizes, and is undoubtedly the most valuable contribution that has been made to this industry, since while it effects the greatest saving it accomplishes the most laborious part of the work. With it, a man and boy can heel five thousand pairs of boots or shoes in a day, effecting a saving of the wages of forty-eight additional operatives per day.

The amount of royalty upon a pair of boots or shoes is one-half of one cent, but by the saving of leather, and the saving of wages, the seller is not only able to dispose of his goods at a less price, but the durability of the boot or shoe is increased tenfold by means of this improvement in the method of manufacture.

No boot or shoe manufacturer could carry on a large business successfully without the Bigelow Heeling-Machine, and the fact that he could not otherwise compete, proves conclusively that the purchaser is the person most largely benefited.

<sup>1</sup> I am indebted to Mr. J. H. Walker and Mr. F. W. Blacker for some of the material used in the chapter upon Boots and Shoes.—C. G. W.

*Geo D Barton*

A. H. Dean, in 1866, established the business of manufacturing shoe-heels from upper leather remnants bought at the boot and shoe factories. He was among the first in the country to engage in this occupation as a distinct business. Heels had been made for the most part of sole leather in shoe factories. Most of this work is done by hand. The heel pieces are cut by dies. The business has so grown that there are now two hundred concerns in the country in this special line of work. From twelve hands Mr. Dean's business has grown into the employment of one hundred and fifty.

In March, 1861, T. K. Earle & Co. sold their belt manufacturing tools to Graton & Knight, a firm formed March 11, 1861, and composed of H. C. Graton and Joseph A. Knight, located in Harding's Block, on Front Street. They started their tannery on the Bloomingdale Road in 1867, and now put in about six hundred hides per week. They use oak bark, which is ground in Virginia. The belting is taken in strips from the tannery to the Front Street shop, each hide affording three strips suitable for this purpose. This is at present the only tannery in the city. In the upper story of the Bloomingdale Building they manufacture inner-soles and slip-taps, and heels of all kinds, made from sole leather. In this way the shoulders and bellies are used. They also make sole-leather counters for boots and shoes, moulded and flat counters of all kinds, straps for looms and pickers and for harvesting-machines. They started in Foster Street with three hands, and at that time had a shop in Lynn; that branch of the business was later removed to Worcester. They now employ ninety hands, and ship part of their product to England. There are but four larger concerns in the belt business in the country.

H. O. Hudson & Co., successors to Peter Goulding, established in 1854, manufacture leather belting, rubber belting, loom straps, etc.

J. F. & C. G. Warren also manufacture leather belting.

Boot and shoe and belting machinery is made by A. F. Stowe, on Cypress Street.

H. C. Pease & Co. and John J. Adams also manufacture shoe machinery.

Samuel Mawhinney, in company with Mr. A. P. Richardson, commenced the manufacture of lasts January 1, 1857, in Merrifield's Building. At that time the lasts were turned out in the rough in Canada and finished in Worcester. In 1868 Mr. Richardson retired, and in 1869 Mr. Mawhinney bought land on Church Street and built his present shop. About that time Mr. R. L. Golbert became a partner. The business has constantly increased, and now employs from twenty-five to thirty hands. One hundred thousand pairs of lasts are made annually. The material used is rock maple. In addition to the last business, this company makes boot and shoe trees.

**DIE MANUFACTURERS.**—Mr. A. M. Howe began the die business in Westboro' in the year 1857, and moved to Worcester in 1860. In 1861 he had a contract from the Government to make primers for guns. Mr. Howe makes boot and shoe, envelope and harness dies; in fact, cutting dies of almost every description. He formerly bought his die stock from the Coes', but now prepares it under a patented process of his own.

Davis, Savells & Co. is the only other concern in the city which makes dies. They commenced business in 1870. Mr. Davis was formerly in the employ of A. M. Howe.

## CHAPTER CXCIX.

### WORCESTER—(Continued.)

#### MANUFACTURING AND MECHANICAL INDUSTRIES.

*Paper Machinery—Razors—Holyoke Machine Company—Norton Emery Wheel Company—Orsels—Skates—Chairs—Gas—Contractors and Builders—Summary of Industries not heretofore mentioned.*

**PAPER MACHINERY.**—Isaac Goddard was born in South Royalston, Vt., in 1800. He came to Massachusetts in 1812, and was apprenticed to Elijah Burbank at Quinsigamond to learn paper-making. After serving his time, he went to Millbury, and about 1823 made paper there by the pound for General Burbank. In 1836 he came to Worcester, formed a partnership with Mr. Howe, and, under the firm-name of Howe & Goddard, began making paper machinery at the old Red Mills. It is said that six months after starting they put in a steam-engine of six horse-power. This they used for two years, in conjunction with their water-power. February 1, 1843, they moved to the Union Street factory, now occupied by their successors. In the summer of 1846 Mr. Howe died, and Mr. George M. Rice shortly after became a partner.<sup>1</sup>

In April, 1856, Goddard, Rice & Co. bought from Isaac Davis, for thirty-one thousand dollars, the factory occupied by them in Union Street. April 1, 1862, Goddard, Rice & Co. dissolved, and May 1st George M. Rice, George S. Barton and Joseph E. Fales formed a company for the manufacture of machinery under the style of Rice, Barton & Co. At this time they advertised to make steam boilers, and in 1863 manufactured the Vandewater Water-wheel.

The Rice, Barton & Fales Machine and Iron Company was organized in 1867, and succeeded to the business of manufacturing paper-making, calico-printing and dyeing machinery, printing and dyeing-machines for cotton and woolen-mills, bleaching,

<sup>1</sup> George S. Barton came to Worcester in 1845; was apprenticed to Howe & Goddard, and in 1849 became a partner in Goddard, Rice & Co.

paper-printing machinery, hydraulic presses, architectural iron and other large work.

**RAZORS.**—J. R. Torrey & Co. manufacture razor strops and dressing-cases, and are situated at the corner of Piedmont and Chandler Streets. The business was begun in a very small way in 1858 by J. R. Torrey. In 1875 his son, L. H. Torrey, was admitted to partnership. The business has increased until they have become the largest manufacturers of razor strops in the world.

The J. R. Torrey Razor Company was incorporated in 1880—Joseph Turner, president, and J. R. Torrey, treasurer. The present factory was erected in 1882.

This is the only company manufacturing razors in the country. Commencing with eight hands, their force to-day, 1889, numbers seventy-five razor-makers, with more special tools and machines of their own invention than are found in all the razor factories in the world.

**THE HOLYOKE MACHINE COMPANY.**—This company was established at Holyoke in 1863. In 1882 a branch factory was built at Worcester, situated opposite the old Wheeler Foundry on Thomas Street. This company manufactures the Hercules Turbine Water-Wheel. One-fourth of their product is sold abroad. They commenced with fifty men and now employ one hundred and fifty. They also manufacture shafting, hangers and pulleys.

**NORTON EMERY-WHEEL COMPANY.**—This company was organized June 20, 1885. The industry was started in 1875 by F. B. Norton at the old Pottery Works in Water Street, from whom the wheel takes its name. The pottery business is still conducted by Mr. Norton's sons in Water Street.

In July, 1886, the Norton Emery-Wheel Company began the erection of new works at Barber's Crossing, about three miles from the centre of the city, at the junction of the Boston and Maine and Fitchburg Railroads. The building was finished and occupied about January 1, 1887, and is more complete and thoroughly equipped than any other manufactory of emery-wheels in the world. The method of producing solid emery-wheels by this company is known as the vitrified process and is covered by three patents. The wheels possess great strength and endurance, are thoroughly water-proof, containing no substance that has not abrasive properties which ensures their fast-cutting qualities. The best Turkish emery ore and pure corundum are used. During the process the wheel is subjected to a white heat, for which purpose the Lawton Patent Down-Draft Kilns are used.

These wheels are used for all descriptions of light and heavy casting-work, car-wheel grinding, cleaning hollow-ware, pearling barley, cleaning wheat and cotton seed, wood pulp, grinding, planing and surfacing work, cutlery work, concaving razors and other uses too numerous to mention.

Brown & Sharpe Manufacturing Company of Providence, R. I., has succeeded in producing remarkable results with these wheels in the direction of fine grinding.

**CORSETS.**—In the year 1861 Mr. D. H. Fanning finding that hoopskirts were becoming popular, secured a small room in what was then Clark's Block situated at the corner of Main and Mechanic Streets, and with one operative began their manufacture.

The product of this small establishment found a ready sale. He continued the manufacture of hoopskirts exclusively until the year 1864, when the manufacture of corsets was introduced into this country and Mr. Fanning added this industry.

The plant was enlarged to meet the increasing demands made upon it. In 1872 the business was removed to the Rice building, 564 Main Street. The manufacture of corsets proved the more important part, and at length the manufacture of skirts was discontinued. The name of the firm, at first the Worcester Skirt Company, was changed to the Worcester Corset Company, which was afterwards made the corporate name of the present organization.

The business continued to develop, and subsequently a section of the Franklin building, adjoining, was added. In 1880 the Heywood building, located in the rear of the Rice building, was added to the other two. The plant now includes these three buildings with a floor area of fifty thousand square feet.

The sewing-machines used are of the Singer make. The old machines were run at a speed of from four hundred to six hundred stitches per minute, while those now in use have a capacity of from fourteen hundred to eighteen hundred stitches per minute.

In 1885, finding the market for its products reaching over a constantly increasing area, at length covering the entire country, the Worcester Corset Company established branch sales-rooms in Chicago, Ill., the great distributing point for the West and Northwest, and also opened an office in New York City.

Within the past year the company has entered extensively into the manufacture of fine goods in which silks, pongees, satins, French cotilles and American jeans are used.

By engaging in the manufacture of fine goods, the company gives employment to an increased number of skilled workmen of the highest class. These goods are of the same grade and come into competition with the finest quality of French and German corsets; and there is no concern in the country engaged in this business so thoroughly equipped for the production of fine goods as the Worcester Corset Company.

In size it ranks among the largest producers in the country of all grades of corsets, and probably the largest in the production of fine goods. Five hundred operatives, mostly women, are employed in this establishment.

The Park Corset Works, in Front Street, was established in 1868, and incorporated in 1885.

*J. H. Vorciob*

*O. W. Norcross*

In 1856 S. C. & S. Winslow, who had been engaged in mechanical business at Newton Upper Falls, occupied a small room in Cypress Street, in Merrifield's building, doing machine jobbing.

In 1857, observing that skating was becoming popular, they ventured to make twenty-five pairs of skates, of which they sold nineteen pair during the first year.

In 1858, in anticipation of the demand, they manufactured two hundred pairs, but before the end of the year had manufactured and sold two thousand five hundred pairs.

Seth C. Winslow died in 1871, and his interest was purchased by Samuel Winslow.

In 1872 Mr. Winslow made roller-skates for J. L. Plympton, of New York, which were used in this country, and exported to Europe and to India, and continued to manufacture them for several years; meantime the business had so increased that a factory was built in Mulberry Street.

In 1880 Mr. Winslow invented the Vineyard roller-skate, which has been the most popular roller-skate made. The demand in this country for roller-skates continued till the fall of 1885.

During the year 1884 Mr. Winslow built an addition to his factory. In 1886 he sold his business to the Samuel Winslow Skate Manufacturing Company.

At the present time, 1889, the demand for roller-skates in the United States has ceased, but the company is exporting them to Australia, India, Japan and South America.

The capacity of the company is twelve hundred pairs of skates per day, including forty different styles of ice-skates and fifteen different styles of roller-skates, which vary in price from fifteen cents to ten dollars per pair.

This company also manufactures an excellent bicycle, which is sold at a moderate price, and which is finding a ready market for the reason that it is as durable as the more expensive machine.

**FOLDING CHAIRS.**—In 1863, Mr. E. W. Vaill, who had previously been in the furniture business, engaged in the manufacture of camp-chairs, which were in large demand by the army and navy. The business was begun at the corner of Main & Walnut Streets, but in January, 1877, was moved to Union Street, the present location. The old water-wheel, which furnished power for Ruggles, Nourse & Mason, at Court Mills, supplies twenty-eight horse-power for this factory.

At the close of the war the demand for camp-chairs largely decreased, but the principle was carried into all variety of chairs, from the plainest to the most expensive. Over one hundred different styles were made, many of which were patented, and they were sent all over the world. February 5, 1889, the E. W. Vaill Chair Manufacturing Company was incorporated and succeeded to the business.

The Worcester Gas-Light Company was organized

June 22, 1849, with a capital of \$45,000. John W. Lincoln was president, and Warren Lazell, agent.

The works were built in Lincoln Street, and, under date of July 23, 1849, the company gives notice in the Worcester *Spy* that the works will be ready to supply gas to the citizens of Worcester in the following streets, early the next fall, viz.: Main Street, from Lincoln Square to Park Street School, Thomas' Exchange, Foster and Mechanic Streets, severally, between Main and the railroads; also in Front from Main Street to Washington Square, and in Pleasant Street from Main to Chestnut Streets.

Those desirous of becoming consumers of gas were requested to give early notice at the office of the agent, 205 Main Street, in order that supply-pipes might be carried into their buildings, the pipes to be put in at the expense of the company.

The company was incorporated in 1851; the works were enlarged from time to time, and in 1870 were removed to the present site near the Junction.

The present estimated capacity of the works per day is 750,000 cubic feet. Gas made during the year ending June 1, 1888, 100,724,500 cubic feet; greatest output December 24, 1887, 501,300 cubic feet; least output, June 17, 1888, 112,600 cubic feet; total length of street mains, 201,950 feet; total number of meters in use June, 1888, 3,882.

The manufacture of water-gas was introduced in October, 1884, the company having purchased a license under the patents of the Granger Water-Gas Company, of Philadelphia.

**CONTRACTORS AND BUILDERS.**—There is a large number of contractors and builders in Worcester, some of whom have attained a wide reputation for the character of their work. The wood-work in some of the most expensive houses in the country has been furnished by Worcester firms.

Charles Baker & Co. make a specialty of inside and outside ornamental finish from architects' plans.

The Norcross Bros. stand pre-eminent among builders in Worcester, and their reputation has now become national. They own stone quarries at Long Meadow and have shops equipped to produce every kind and variety of work required in the most elaborate buildings.

The Norcross Bros. began business at Swampscott, Mass., in 1864, and 1866 took their first contract of any consequence, which was to build the Congregational Church in Leicester.

Since that time they have built educational structures, business blocks, churches, public buildings, club-houses and private residences.

Among the buildings erected by them are the Worcester High School, Crompton's Block, Burnside Building, All Saints' Church, the First Universalist Church, all of Worcester.

Their most expensive buildings have been erected elsewhere. The gymnasium, Seaver Hall and the Law School at Harvard University; the Marshal

Field Building, at Chicago, erected in 1885 at a cost of \$900,000; the New York Life Insurance Building, at Omaha, costing over \$500,000; another building for the same insurance company in Kansas City, costing a like amount; the Allegheny Court-house and jail, at Pittsburgh, costing \$2,500,000; the Union League Club-house, New York; the Algonquin Club-house, Boston; besides many private residences, the most expensive of which is "Kellogg Terrace," Great Barrington, which cost \$600,000.

It has not been attempted to give an extended account of all the manufactories in Worcester; space and time would not permit of this. The following alphabetical summary of most of those not hitherto mentioned in the text will give some idea of their variety and number:

**AGRICULTURAL MACHINERY.**—B. F. Goddard, mowing-machines, 195 Front Street.

**AWLS.**—American Awl Company, 195 Front Street, manufacturers of and dealers in raw-hide mallets, wax thread needles, lasting-machine awls, wax thread awls, Bigelow heeling awls, Bigelow heeling drivers, New Era drivers, New Era pegging awls, Varney pegging awls, Varney drivers, German pegging drivers, German pegging awls, shoe-knives, shoe-shaves.

J. McCarty, 19 Church Street, proprietor National Awl Company; established 1878; machine awls for pegging-machines.

Sumner Packard & Co., of Grafton, made the first machine awls for boot and shoe-pegging machines.

**BAND-SAWS.**—W. F. Burgess & Co., 66 School Street.

**BICYCLES.**—Iver Johnson & Co.; Samuel Winslow.

**BOLT MANUFACTURERS.**—In 1828 Wheelock & Rice manufactured nuts and washers at the machine-shop then recently occupied by William Hovey.

In 1839 H. W. Miller was engaged in this business.

In 1855 Thomas Smith and William Conkey bought of J. and J. C. Brown and George Dryden their tools and interest in the manufacture of nuts and washers, chain links, etc., and fitted up a shop in Cypress Street, Merrifield's building. In 1859 they employed four hands making patent bit pieces and doing cold punching. Mr. Smith has been an iron-worker in Worcester for fifty-three years; he made the first die in the world to make a mowing-machine knife. He now manufactures bolts, nuts, rods, building irons for houses, bridges, cold iron punching. In 1835 Mr. Smith worked for Phelps & Bickford, in Grove Street, and worked on the first looms built for William Crompton in this country.

J. Fred. Wilson, cold punched nuts, washers, chain links, etc.

**BOOT AND SHOE LASTS.**—Porter & Gardner, Foster Street.

**BOOT AND SHOE MACHINERY.**—John J. Adams, 85 Mechanic Street.

**BOX-MAKERS, (WOOD AND PAPER).**—Baker & Co., Foster Street; C. F. Darling, 66 Foster Street; J. W.

Howe, 163 Union Street. C. W. Humphrey, 42 South-bridge Street, turns out from five thousand to six thousand paper boxes per day. The Whitcomb Envelope Company also make paper boxes.

**BREWERS.**—There was a brewery in Worcester in 1822. Sixty-two and one-half cents a bushel was paid for barley delivered at the brewery. In 1827 the Worcester Distillery offers for sale New England rum, molasses, cider brandy, high wines.

Bowler Brothers, Quinsigamond Avenue, corner Lafayette Street, established the business of brewing ale and porter in 1883. They pay a larger tax to the United States Government than any one outside of Boston.

**BROOMS.**—O. M. Dean, 170 Austin Street.

**BRUSHES.**—Ellis Thayer manufactured brushes in Worcester in 1849. In 1869 the firm became Thayer & Mason; in 1878 Mr. J. Fred. Mason became proprietor. He manufactures brushes of all descriptions.

**CARDERS' TOOLS.**—William H. Brown, 81 Mechanic Street, Lewis' patent card clamps, card ratchets, hammers, gauges, tools, scrapers, Kimball's patent card stretcher.

**CLIPPING-MACHINES.**—Coates' Clipper Manufacturing Company, 237 Chandler Street.

**COPYING-PRESSES.**—R. E. Kidder, 35 Hermon Street. Also manufactures patent Universal Sewing-Machine.

**COTTON.**—H. W. Smith, Wachusett Mills, fine dress ginghams.

**COURT-PLASTER.**—C. B. Robbins, 76 Portland Street.

**CURRIERS.**—P. Corriveau, 32 Hermon Street.

William Leonard, 2 Sargent Street.

**CURTAIN POLES AND RINGS.**—Worcester Moulding Works, Foster Street.

**DENTAL INSTRUMENTS.**—C. B. R. Claffin, 38 Front Street.

**DIE CUTTER STOCK.**—Loring Coes & Co., manufacturers of machine knives, cutter plate for dies to leather, cloth and paper; moulding cutter-plate for wood, marble, etc.; all kinds and sizes of shear plates, and strips for cotton and woolen machinery.

L. Hardy & Co., manufacturers of machine knives, straight cutter ensilage, lawn-mower, meat-cutter, cork-cutter, rag-cutter and bone knives; shear-blades and strips for cotton and woolen goods. Also die cutter stock for boots and shoes; all kinds of welded stock rolled to any thickness from fourteen gauge to three-quarter inch thick. Wood-working machine-knives, planers, moulding-knives and blanks; paper-cutting, leather-splitting and stripping-knives.

**DOORS, SASH, BLINDS, &C.**—Charles Baker & Co., wholesale and retail lumber dealers; manufacture doors, windows, blinds, window and door frames, inside and outside ornamental finish from architects' plans. Yards at Manchester, Grove and Prescott Streets.

A. W. Joslyn, 181 Union Street.

George Peirce, 330 Park Avenue.

D. & C. P. Stevens & Co., 24 Southbridge Street.

Rice & Griffin Manufacturing Co., Sargent Street.

William Ross, 138 Main Street.

**DRAIN PIPE.**—James Draper, drain sewer and well pipe, Bloomingdale.

A. B. Lovell, cement pipe.

S. E. Todd, Southbridge Street.

**DRILL MANUFACTURERS.**—Six in number, some of whom have already been mentioned.

George Burnham & Co., 15 Hermon Street, improved upright drills.

R. W. Long, successor to George C. Taft, No. 8 Harris Court, improved upright self-feed drills.

Lowell Wrench Company. Ratchet drills, ratchet wrenches.

Prentice Bros., 49 Hermon Street. Upright drills.

**DROP FORGINGS.**—Worcester Drop Forging Works, No. 30 Bradley Street. Quick-action vises; shuttle irons.

**DRY PLATE MANUFACTURERS.**—Phoenix Plate Company, manufacturers of Phenix gelatine dry-plate, argentic plate for positive pictures, ebonized and maroon wood and metal panels; also japanned iron and tinned sheets of all sizes for painters and lithographers.

**DYE-HOUSES.**—In 1828 William B. Fox did dyeing of all kinds.

John H. Starkie, Layard Place.

Worcester Silk Co., 390 Main Street.

Worcester Bleach and Dye Works, dyers and bleachers of cotton, woolen and worsted yarns, threads, tapes, etc. Also black, white and fancy colored warps in chains and beams furnished to order in any desired pattern. Present location, Grove Street. After April 1, 1889, West Fremont Street, New Worcester.

**EAVE TROUGHS.**—A. Bangs & Co., 175 Union Street.

**ELEVATORS, HYDRAULIC.**—Washburn Shop, Polytechnic Institute.

Hydraulic Manufacturing Co., 23 Hermon Street.

Worcester Elevator Co., 47 Lagrange Street.

**FAUCETS.**—Worcester Faucet and Manufacturing Co. Self-closing faucet.

**FERRULES.**—Worcester Ferrule Manufacturing Co., manufacturers of steel and brass stove trimmings, patent nickel-plated knobs, hinge-pins, towel-racks, foot-rails, steel, iron and brass ferrules, nickel-plated steam-pipe collars, 17 Hermon Street.

John L. Parker & Co., manufacturers of patent seamless sheet-metal goods of every description, stove door-knobs, hinge-pins, towel-rods, 70 School Street.

**FILES.**—William Hart, 5 Washington Square; established 1867, now employs seventeen hands. Largest manufacturer of hand-cut files in New England. A large number of files from the manufactories in the city are here re-cut. Mr. Hart makes four hundred

different shapes and sizes of files, and has a branch shop at Holyoke.

A. J. Hiscox.

**FISHING-RODS.**—N. S. Harrington, 72 Portland Street.

**FRAMES FOR PICTURES.**—G. S. Boutelle & Co., successors to Worcester Moulding Works. Also, picture-frame easels, fancy tables, etc.

**FRICTION PULLEYS.**—Blake Bros., manufacturers of the patent friction clutch, shafting, hangers and special machinery, Union Street.

**GLUE.**—John J. Jefferds, manufacturer of glue, tallow, ground bone, fertilizers. Works half a mile south of Quinsigamond, on Providence and Worcester Railroad.

**GRINDING MACHINERY.**—B. S. Roy, for card grinding.

Washburn Shops, for emery wheels.

**GRIST-MILLS.**—D. & C. P. Stevens & Son.

**GROUND BEEF SCRAPS.**—Charles F. Rugg, manufacturer of fine cylinder, engine, machinery and bolt oils. Best grade steam-rendered tallow and soap for manufacturers and family use. Dealer in paraffine, lard and neat's-foot oils. Pure ground beef scraps.

**GUTTERS AND CONDUCTORS.**—A. Bangs & Co., 175 Union Street, manufacturers of eaves troughs, &c.

J. B. Cummings, 197 Union Street.

**HARDWARE MANUFACTURERS.**—A. W. Gifford, 77 Beacon Street

Hill Dryer Co., 21 Hermon Street.

A. McDonald, 418 Main Street.

Morgan Spring Co., 25 Lincoln Street.

Wire Goods Co., 20 Union Street.

**HEEL MANUFACTURERS.**—E. D. Barrows & Son, 195 Front Street.

E. N. Dean, 194 Front Street.

A. D. Hall, 164 Front Street.

G. S. Hatch, 164 Front Street.

Myrick, Shepard & Co.

**HOSIERY.**—Holland Hosiery Company, 194 Front Street.

**INK.**—Levi R. Rockwood, 23 Orient Street.

**LOOM REEDS.**—For cotton, woolen, carpet and wire cloth mills, John Whittaker, 194 Front Street.

**MILK CANS.**—James H. Whittle, manufacture of tin cylinders of all diameters.

**MOULDING-MACHINES.**—Blake Brothers.

Witherby, Rugg & Richardson.

**NAILS.**—Somers Brothers. Tacks and Hungarian nails. Shoe tacks a specialty. Located here because of the large amount of boot-making. Running seventeen machines. The only concern of the kind in the city. Uses tack-machines invented by Thomas Blanchard.

**NEEDLES.**—Worcester Needle Company, Sewing machine needles. In 1853, F. S. Cox made needles at South Worcester.

**OVERALLS.**—A. G. Hildreth, 34 Southbridge Street.

**PERFORATED METALS.**—Towne & Company, 81 Mechanic Street.

**POTTERY.**—F. B. Norton's Sons, Water Street. In 1784 there was a pottery in Worcester, two and a half miles from the meeting-house on the road to Springfield.

**ROLLER SKATES.**—The Samuel Winslow Skate Manufacturing Company. Ice and roller skates; gear cutting.

**SAW MANUFACTORY.**—E. D. Cunningham, 23 Hudson Street.

**SHAFTING.**—Holyoke Machine Company.

**TAPES.**—H. M. Witter & Company, Park Avenue.

**TRUNKS.**—Barnard Brothers, 494 Main Street.

George L. Barr, 20 Front Street.

**VALENTINES.**—Bullard Art Publishing Company, Main Street.

J. W. Taft, 35 Pearl Street.

George C. Whitney, Art Publisher and Importer; factory and main office, Worcester; also offices New York, Chicago and Boston.

**VICES.**—Worcester Drop Forging Work.

**WASHERS.**—Reed & Prince, makers of rivets, blanks for small screws, washers.

**WATER METER.**—In 1858 a water meter was invented by Dr. E. D. Wetherbee, and manufactured by D. Newton, gunsmith. Union Water Meter Company was established November, 1868, by Messrs. Fitts, John C. Otis, Phineas Ball; employs sixty hands. Their meters go all over the country, and some to England and Germany. The product is covered by patents.

**YARNS.**—The Edgeworth Mill, carpet yarns, Brussels Street.

Artificial stone is manufactured by C. F. Green & Company, Sargent Street. The stone is made of sand and cement, and is used for building purposes; chimney caps, thimbles, etc. This is a continuation of the business known as the Frear Stone Works.

E. J. Kerns manufactures a patent rowlock; also roller seats for boats. Some of these have been sent to foreign countries.

## CHAPTER CC.

### WORCESTER—(Continued.)

#### MANUFACTURING AND MECHANICAL INDUSTRIES.

*Reasons for Worcester's Prominence as a Manufacturing City—Room with Power for Rent—Merrifield Building—Heywood Building—Estabrook Building—Enterprise of Worcester's Business Men—Mechanics' Association—Worcester Polytechnic Institute—Washburn Shops—The Laboring Classes—Evening Schools—Worcester's Rapid Growth—Heart of the Commonwealth.*

It has frequently been said that Worcester owes her prominence as a manufacturing centre to the unusual opportunities offered to mechanics to begin business in a small way, and without incurring the

risk incident upon the erection and equipment of a shop. Indeed, had this not been the case, individuals, companies and corporations doing to-day a prosperous business would never have started. Many instances might be given of individuals who have begun with one machine, gradually increasing their business out of the profits realized from day to day, until it has reached considerable magnitude. Growth of this kind is healthy and likely to be permanent.

It would be almost literally true to say that there is no large manufacturing business in Worcester that has not at some time in its history been situated in one or another of the buildings erected for rent with power to a number of tenants. There are some exceptions, but they are few. An idea of the number of industries begun in this way may be obtained by noticing the occupants of the buildings erected for the accommodation of those engaging in mechanical pursuits.

The old Court Mill had been built some years when, in 1832, Samuel Davis leased it from Mr. Salisbury. Among the tenants here at one time or another were L. & A. G. Coes, builders of woolen-spinning machinery, and subsequently, manufacturers of wrenches; Ruggles, Nourse & Mason, manufacturers of agricultural implements; H. W. Miller, punching-machines for manufacturing nuts and washers; Thomas E. Daniels, builder of the planing-machine; Samuel Flagg, pioneer in the machinists' tools business in Worcester. The old building was burned in October, 1839, and Mr. Salisbury made a contract with W. T. Merrifield to rebuild the mill by January 1, 1840, for Ruggles, Nourse & Mason threatened to move out of town unless it were finished by that time. After the foundations were in, Mr. Salisbury thought the building could not be completed in the winter, and offered to release Mr. Merrifield from the contract, but Mr. Merrifield went ahead, although Worcester masons refused to lay brick in the winter, and he was compelled to bring masons from Boston to do the work. The building was completed by January 1st.

Then came the Dr. Heywood building in Central Street, occupied by a number of firms, among them Samuel Flagg & Company and S. C. Coombs & Company, who established the business now conducted by the Lathe & Morse Tool Company. Mr. Merrifield occupied his present location in 1835; soon after he used a horse to furnish power to run a circular saw and a Daniels planer. In 1840 he put in an engine. The first brick building for tenants was erected in 1847, and additions were made to it every year until the fire of 1854, when the following were among the occupants: William R. Bliss, bootmaker; Town & Company, perforated board; Hovey & Lazell, straw-cutters; E. F. Dixon, wrenches; Lamb & Foster, carpenters; Williams, Rich & Company, machinists; Samuel Flagg & Company, machinists' tools; Prouty & Allen, shoe tacks; Daniel Tainter, wool machin-

*Geo. C. Whitney*

ery; C. Hovey & Company, straw-cutters; C. Whitcomb & Company, machinists' tools; Charles E. Wilder, boot and shoe-machines; H. Palmer & Company, box-maker; Towne & Harrington, portemonnaies; N. B. Jewett, seraphine-maker; Thayer, Houghton & Company, machinists' tools; Furbush & Crompton, fancy looms; Richards & Smith, sash and blinds; Luther White, machinist; F. J. Gouche, plane-maker; Isaac Fiske, musical instruments; A. Sampson, wheelwright; S. G. Reed, wheelwright; Worcester Knitting Company; Worcester Machine Company; George Dryden, machinist; Hood, Battell & Company, sewing-machines; Edward Lawrence, tool-maker; Daniel Palmer, box-maker; Howard Holden, grist-mill; Rodney A. M. Johnson & Company, wool-spinning machinery.

When rebuilt, the buildings measured over eleven hundred feet in length, fifty feet in width, and three stories in height; the area of the floors was over four acres and a half; the power was obtained from a three hundred and fifty horse-power engine, the same which is running to-day. In 1859 Mr. Merrifield had leased rooms and power in his buildings to over fifty firms, each employing from two to eighty hands. Among them:—

Alzirus Brown, on the corner of Union and Exchange Streets, who, with fifty hands, engaged in the manufacture of Manny's Patent Mower and Reaper combined. Daniel Tainter, in Union Street, employed thirty hands in making woolen-carding machines and jacks. Johnson & Co. employed twenty hands making jacks for woolen machinery. Richardson & Mawhinney, in the same street, employed twenty-four hands on lasts and boot-trees. L. W. Pond occupied about two hundred feet of the first floor, under the preceding, for the manufacture of engine-lathes, planing-machines, etc., employing twenty-seven hands. He had a lathe thirty-seven feet long, capable of cutting screws of any length from one to thirty-three feet. He also used the largest and heaviest planing-machine in the city, thirty-seven feet long, six feet wide and four feet high, weighing forty tons.

Prouty & Allen, in the room north of Mr. Pond, employed from five to six hands in making iron or zinc shoe-nails, of which they turned off from one thousand to twelve hundred pounds per day. Battelle & Co., in the third story, had five hands engaged in the manufacture of sewing-machines. J. L. & I. N. Keyes, on the east side of Union Street, did an extensive business, with eighteen hands, in board-planing. Hamilton Holt, in rooms over them, had four hands engaged in making patent gutters, or conductors of water from the roofs of buildings. C. Whitcomb & Co. were doing a good business making machinists' tools and letter-copying presses, and employed fifteen hands. Towne & Harrington, with ten hands, made mowing-machine knives. Dresser & Wilson had about six hands making Jillson's patent animal-traps, manufacturing two hundred per day. S. G. Reed &

Co., in Cypress Street, employed twenty hands in making carriage-wheels and wheel-spokes of all kinds.

George F. Rice, employed ten hands in the manufacture of Hovey's patent hay-cutters, corn-shellers and winnowing-mills, and a very superior article of boring-machine of his own invention. Joel W. Upham had from six to eight hands engaged in making very large water-wheels for manufacturing establishments, averaging from twenty to thirty per year. Isaac Fiske employed six hands making musical wind instruments. D. D. Allen & Co. manufactured boot forms. S. C. & S. Winslow employed from six to twelve hands in gear-cutting and light jobbing. Thomas Smith & Co. had four hands making patent bit-pieces and doing cold punching. The Machine Lathe Company in Exchange Street, of which Jason Chapin was president and A. L. Burbank treasurer, employed seven hands making bedstead lathes and in iron job-work. Charles E. Staples, with seven hands, made bit-stocks and window-springs and did light jobbing. Charles E. Wilder had a few hands in the manufacture of boot-crimping machines. Franklin Wesson had three hands in the gun manufacture. P. Goulding with six hands, on the opposite side of the street, made thirty dozen of shuttles per week. U. T. and C. H. Smith made chair-lathes and did jobbing, employing four hands. William H. Brown had a jobbing shop with three or more hands.

Meantime Colonel James Estabrook and Charles Wood, in 1851, erected the stone building at the Junction now occupied by the Knowles' Loom Works. Wood, Light & Co. were to occupy part of it, which they did, and the rest of the building was to be rented to tenants. Shepard, Lathe & Co. moved into the north end of the building very shortly after the occupancy of Wood, Light & Co. In 1857 Mr. Wood disposed of his interest to Colonel Estabrook.

The main building was four hundred and fifty feet long by fifty feet wide, and three stories high; another building used for a forge shop and other work, two hundred by forty; power was furnished by two fifty horse-power engines, made by Corliss & Nightingale, of Providence. Among the tenants were Wood, Light & Co., who occupied the two lower stories in the south end of the main building for the manufacture of machinists' tools, water-wheels, mill works, castings. J. A. Fay & Co. occupied a hundred feet on the second floor, manufacturing wood-working machinery, employing thirty hands. Joseph Barrett & Co., in the south end of the second floor, employed twenty hands in the manufacture of calico-printing machinery, Woodworth's planing-machines, machinists' tools, etc. Shepard, Lathe & Morse occupied one hundred feet of the first floor under the preceding, and manufactured engine-lathes and iron-planing machines. Whittemore Brothers, in the upper story, employed twenty hands in manufacturing machines for paring, coring and slicing apples. The American

Steam Music Company manufactured calliopes and terpsichoreans. Heywood & March made Holbrook's automatic bank-locks. David McFarland made card-setting machines. A. F. Henshaw manufactured machinists' tools and bonnet machinery.

The means thus afforded to individuals with limited capital to begin manufacturing unencumbered with an expensive plant, making it possible for a small business to be conducted with profit, is one of the chief causes of the diversity of industries which makes Worcester uniformly prosperous, and creates a thrifty and permanent class of working-people.

In striking contrast are some other New England cities, confined almost entirely to a single industry, and with a large unsettled population of mill operatives, the business conducted by corporations, owned by non-resident stockholders and under a non-resident management. With such conditions, the prosperity of the community is uncertain, largely a matter of chance. In good years the dividends declared are not invested where they are earned, while in bad years the immediate community suffers, want soon overtakes the working-people, and crime follows in the wake of cold and hunger.

It is true that there are corporations in Worcester, but they are, almost without exception, the outgrowth of individual enterprise; the stockholders are residents, and in many cases, employes; the dividends are largely invested in real estate, in business blocks, in tenements, in factory property, while the fortunes accumulated found our hospitals, homes for the aged and infirm, build our churches, endow our schools.

While there are few large fortunes here, there are many small ones. There is, perhaps, less of luxury and display than in some communities, but more of thrift.

To properly take advantage of the opportunities here offered, an intelligent people was needed. Enterprise and sagacity have always been characteristics of the business-men of Worcester—early manifested in appreciation of communication with the sea-board, and secured by the building of the Blackstone Canal, and evidenced later in the building of the railroads, and always recognized in the high reputation enjoyed throughout the country by our manufactures.

But there is better evidence than this of the wisdom and foresight of the men who laid the foundation of Worcester's prosperity.

A desire for opportunities for education was manifest at a very early day. About 1819 a number of young mechanics, who had been active in reforming the schools and establishing a lyceum and temperance society, made an attempt to form a mechanics' association. This failed; but November 27, 1841, a public meeting was held to consider the question. Ichabod Washburn was chairman, and Albert Tolman secretary of this meeting. A committee was chosen, consisting of Anthony Chase, William Leg-

gatt, Henry W. Miller, William M. Bickford, Putnam W. Taft, Levi A. Dowley, William A. Wheeler, Rufus D. Dunbar, John P. Kettell, James S. Woodworth, Albert Tolman, Hiram Gorham, Joseph Pratt, Henry Goulding and Edward B. Rice, to consider the formation of an association having for its object "the moral, intellectual and social improvement of its members, the perfection of the mechanic arts and the pecuniary assistance of the needy."

The first meeting of the subscribers was held February 5, 1842. William A. Wheeler was elected president; Ichabod Washburn, vice-president; Albert Tolman, secretary, and Elbridge G. Partridge treasurer. Steps were taken to establish a library and an annual course of lectures. The first lecture was delivered by Elihu Burritt (then a resident of Worcester), and was upon the importance of educating the mechanics and workmen of the country. From that time to the present the Mechanics' Association has provided a course of lectures every winter.

Another object in forming the association was the holding of an annual fair for the exhibition of the mechanical products of the city. The first fair was held in September, 1848, and was very successful. The reports of the judges were printed and widely circulated, creating a wide knowledge and consequently large demand for the products of Worcester mechanics. In July, 1854, in commenting upon the association and its work, the statement was made: "Notwithstanding the inadequate supply of water-power, which is everywhere deemed so essential for the successful development of the mechanic arts, without the aid of a single act of incorporation, mechanical business has increased in this city by individual enterprise alone more than tenfold. The mechanics as a class are more enlightened and better educated than formerly; their course is onward and upward; they are not only increasing in numbers, but continually expanding in influence and usefulness. Instead of being a small fraction of the population of a town of two or three thousand, as they once were, they are nearly a majority of the population of a city of twenty-two thousand; are the owners of nearly or quite half of the taxable real estate, and are producing from their workshops more than six millions of dollars annually. Their reputation for variety, excellence and finish on all labor-saving machines and implements extends far and wide through the land. Their products, branded with the name of some enterprising firm in Worcester, may be found in the shops, mills and factories and on the farms of every State in the Union."

In 1850 an act of incorporation was obtained from the State, and May 4, 1854, Ichabod Washburn offered to give ten thousand dollars towards the purchase of land and the erection of a Mechanics' Hall, provided an equal sum should be raised by the association. The offer was accepted and the condition complied with. In addition to the twenty thousand dollars

thus raised, the association issued bonds to the amount of fifty thousand dollars, secured by mortgage upon the property, and further sums were raised as the work advanced, of which amount nearly forty-four thousand dollars was taken and paid for by two hundred and fifty-six members of the association. Ground was broken July, 1855, and on the 3d of September the corner-stone was laid, the day being observed as a holiday. The building was completed in 1857, and was dedicated March 19th of that year.

Another and striking illustration of the interest taken by the manufacturers and mechanics of Worcester in educational affairs is found in their generous contributions toward the building and endowment fund of the Worcester Polytechnic Institute, a school free to residents of Worcester County.

The founder, John Boynton, of Templeton, provided that the school should be located in Worcester, if the citizens would furnish the funds necessary to purchase a lot and erect suitable buildings. This condition was complied with, and among the contributors were workmen in twenty of the then (1868) largest shops and factories.

At the same time Ichabod Washburn built, equipped and endowed a machine-shop, connected with the institute, in which students were to be taught the practical manipulation of tools. This conception of a school-shop is unique. The maximum number planned for by the founder to be instructed at any one time was twenty. For the past five years over one hundred pupils have received instruction each year.

Meantime the schools of the city have increased in number and efficiency. No child, however poor, need be deprived of a thorough education, free of any cost for instruction, and in the public schools being even relieved of the expense of buying books.

Up to 1840 manual labor in our shops was, for the most part, performed by Americans. Worcester naturally attracted boys from the country, and the farmers' sons became our mechanics.

About this time Irish emigration commenced and, as the heavier kinds of manufacture were introduced, the Irishman became an important factor in our industrial development and indispensable to our material progress.

Since 1880 a large Scandinavian population has been added to Worcester, probably not less than six thousand or seven thousand men, women and children, of which about three thousand are men and boys. They are thrifty, industrious, capable and law-abiding people, who have come to make this country their home. They are found in most of our shops and are employed exclusively in some of them. They support five churches, in which their own language is spoken. Their children attend the public schools; in 1887 the number of children was five hundred and seventy-four.

Another element in our population is the Armenian. There are at the present time about four hun-

dred Armenians in Worcester, the larger number from the province of Harpoot. Very few of them have had any mechanical training, having been engaged, in their own country, in agricultural pursuits, either as peasant farmers or as laborers for farmers. This occupation affords scarcely more than a bare subsistence, the wages being from twenty cents to thirty cents per day. Some of the Armenians intend remaining here and are gathering their families about them. Two-thirds of those now here have been assisted in their emigration by the earlier third. None of the Armenians would contemplate a permanent return to their own country, if assured of work. They are timidly cautious, and do not wish to send for their families until they have earned the means to sustain them for an extended time. They are convinced that a knowledge of the English language is essential and are anxious to improve their opportunities for acquiring it.

The evening schools are invaluable in giving our large foreign adult population an opportunity to acquire sufficient education to become useful and intelligent citizens. An examination of the records shows that out of 691 who attended the evening schools during the past year (1888), 165 were Irish, 155 Armenians, 153 Scandinavians, 111 French, 45 English, 31 American, 14 Poles, 12 Germans, 3 Mexican, 1 Scotch, 1 Portuguese.

These schools are maintained at a cost for each pupil of \$11.68 for the year.

It is an interesting fact that no Scandinavian has ever made application to attend evening school who could not write his name.

At the evening drawing-schools opportunity is afforded to learn free-hand drawing and drafting, of which our intelligent mechanics are quick to avail themselves. The average attendance during the year 1888 was one hundred and thirty-nine.

According to the census of 1885, there were seven hundred and seventy-two establishments engaged in manufacturing and mechanical industries in the city of Worcester; the total capital invested, \$18,344,408; value of stock used in a year, \$15,016,756; total value of goods made and work done, \$28,699,524, the different industries standing in the following order:—Metallic goods, other than iron; boots, shoes and slippers; iron goods; wood and metal goods; building material for building and stone-work; textiles; food preparations; miscellaneous clothing and straw goods; woolen goods; paper and paper goods; leather; printing and publishing; paints, colors, oils and chemicals.

June 30, 1885, there were employed in manufacturing and mechanical industries 16,566 people—13,413 males, 3153 females—of which 2475 were under twenty-one, and 14,091 twenty-one and over; 10,512 of these work by the day, and 6054 by the piece.

The total amount paid in wages in the census year was \$7,060,755.

Worcester has developed from a country town to a large manufacturing city in less than sixty years. The population in 1830 was a little over four thousand, and to-day is probably eighty thousand.

Within that time the steam-engine, the railroad, telegraph and telephone have enormously increased the productive power of labor. The improvement in the condition of the laboring classes is no less marked; contrary to the opinion once held, the introduction of labor-saving machinery has advanced instead of lowering wages; has reduced, instead of extending the hours of labor. The laborer receives a constantly-increasing proportion, the capitalist a constantly-decreasing proportion in the division of gains. Many of our mechanics own their homes, and are naturally deeply interested in the welfare of the city. Avenues for advancement are always open to the capable and industrious. From their ranks will come the leading business men of the next generation, upon whom the continuance of prosperity will depend.

It is worthy of note that the causes of Worcester's prosperity are found within and not without. No abnormal conditions have prevailed, a change in which can bring disaster. No Government works or patronage of any kind have contributed to her advancement. We need not fear the natural advantages of other sections of the country, for there must always be conducted here the manufacture of the finer grade of goods, requiring intelligent and delicate manipulation. As we review the past and forecast the future, we can but feel that Worcester is worthy of her civic seal,—THE HEART OF THE COMMON-WEALTH.

## CHAPTER CCI.

### WORCESTER—(*Continued.*)

#### WORCESTER COUNTY IN THE FREE-SOIL MOVEMENT.

BY WILLIAM W. RICE, LL.D.

WORCESTER COUNTY has always been prominent in all measures tending to moral and social reform. Especially has it been so in everything calculated to extend and secure personal liberty to all of every color and condition in life. The man elsewhere claimed as a slave never failed to find freedom and protection here, and he who sought to establish ownership in the blood and heart of man, to meet opposition and defeat.

In May, 1767, the town of Worcester instructed its representatives to the General Court of the Province,—“That you use your influence to obtain a law to put an end to that unchristian and impolitic practice of making slaves in this Province;” and in

March, 1774, it instructed its representative, Joshua Bigelow, “to resist the most distant approaches to slavery.” Other towns of the county gave similar instructions to their representatives. In 1773 the town of Leicester instructed its representative,—“To discountenance, in every suitable way, the holding of any of our fellow-creatures in a state of slavery.” An eminent historical writer of New York has recently cited at some length the instructions of this town, and added—“It is much to be regretted that the General Court of Massachusetts did not pass some act against slavery and the slave-trade, embodying the wise suggestions of the men of Leicester.”

Colored men from Worcester County fought bravely for the liberty of the State, which thus protected them, at Bunker Hill and in the trenches around Boston. In 1781 the final effort of slavery to maintain itself in Massachusetts was made in the county of Worcester. A colored man, too poor and humble to have even a well-defined and recognized Christian name, who was named in the proceedings as Quack, Quacko, Quork and Quorko Walker, was claimed as a slave by a respectable gentleman of Barre, named Nathaniel Jennison. He claimed that Walker was born his slave, and belonged to him by inheritance. This claim was not agreeable to the good men of Barre, who were then fighting against Great Britain for their own liberty and that of all within the borders of their State. Walker was aided by the prominent men of the town in resisting the claim of Mr. Jennison. In the Court of Common Pleas, June term, 1781, Jennison brought suit against John and Seth Caldwell for enticing away his slave, Quork Walker. This court rendered a judgment in favor of the plaintiff; but the Caldwells appealed the case to the Supreme Court, where the judgment of the inferior court was ultimately reversed. In the mean time the grand jury of the county found an indictment against Nathaniel Jennison for an assault on Quack Walker in September, 1781. The defendant justified on the ground that the party assaulted was his property as a slave. The final hearing was had at the April term, 1783. Levi Lincoln, the elder, and Caleb Strong appeared for the prosecution, while the defendant was represented by John Sprague, of Lancaster, and William Stearns, of Worcester. Addressing the court, Mr. Lincoln said: “Is it not a law of nature that all men are equal and free? Is not the law of nature the law of God? Is not the law of God, then, against slavery? If there is no law of man's establishing, then there is no difficulty in this case. If there is such a law, then the difficulty is to determine which law you ought to obey, and if you have the same view that I have of present and future things, you will obey the law of God.” The court sustained the view of the learned and able counsel for the prosecution. Chief Justice Cushing, in pronouncing the opinion of the court, used the following language: “In the opinion of the

court our constitutional government, by which all of this Commonwealth have solemnly bound themselves, sets out with deciding that all men are born free and equal, and that every subject is entitled to liberty, and to have it guarded by the laws, as well as life and property, and, in short, it is totally repugnant to the idea of any being born slaves. This being the case, I think the idea of slavery is inconsistent with our own conduct and constitution, and there can be no such thing as perpetual servitude by a rational creature, unless his liberty is forfeited by some criminal conduct or given up by personal consent and contract." With these words the chains, hitherto illegally fastened, fell from every human form within the Commonwealth. Massachusetts declared, by its highest authority, that no person ever had been, or could be, held in slavery under its laws. The "Higher Law" was proclaimed in April, 1783, in the Worcester Court House, by Levi Lincoln, the leader of the county bar, afterwards Jefferson's Attorney-General, in terms quite as bold and unmistakable as by William H. Seward, in the United States Senate, three-quarters of a century later, when summoning the North to its final battle against slavery. And the Supreme Court of the Commonwealth sustained the declaration by its authoritative and never-reversed judgment. Jennison was fined forty shillings and costs.

When the Constitution of the United States, adopted at Philadelphia in 1787, was submitted to the several States for ratification, the Massachusetts convention, held at Boston, January and February, 1788, only agreed to it by a slender majority. One of the grounds of objection was its attitude towards slavery and the slave trade. The vote was taken by counties. Worcester County gave seven votes for its adoption and forty-three against it. This vote may fairly be regarded as in a considerable degree indicating the position of the county at that time on the question of slavery.

This is not the place to dwell at any length upon that great, we may say that magnificent, measure which the government took at the outset, known as the ordinance of 1787. By it, the entire territory northwest of the Ohio River was made free soil forever, and slavery therein forever prohibited. The State of Virginia had a controlling voice in that decision; and her leading statesmen—and the United States had none superior—gave full consent to that prohibition. But the needful labor of bringing the subject to the attention of Congress, of keeping it there, and of persistently urging action upon it, until action was had, was done largely by Massachusetts men, prominent among whom, and a leader of the very highest intelligence and sagacity, was General Rufus Putnam, of Rutland, Worcester County. He was foremost in settling Ohio with free colonists, as, in the final contest between the same great powers, Kansas was colonized under Worcester County influences.

Slavery, notwithstanding, grew and increased in aggression and menace. The admission of Missouri in 1821 as a slave State, and the adoption of the parallel of  $36\frac{1}{2}^{\circ}$  as a line south of which slavery might have full control, furnished proof of the strength of the slave power, and inflicted severe disappointment upon the friends of a free republic. The North was advised to be content with its share of free territory, and an "era of good-feeling" was somewhat sharply inculcated. But it could not long endure. In 1830–31 William Lloyd Garrison made the first challenge of slavery as a sin against God and man, the first uncompromising stand against its longer duration. "Immediate and unconditional emancipation," was his demand. He established *The Liberator* in Boston, and continued it without interruption until slavery was made unconstitutional and illegal in every part of the land. The conscience and religious feeling of the nation responded to his call; if slowly, surely; and the effects of his demand were felt on all sides.

Worcester County gave an early response by subscribing largely to the *Liberator*, and engaging in anti-slavery labors therein suggested. Lecturers and distributors of anti-slavery literature went into every town, and found a hearing. Anti-slavery societies were formed in many towns. Under the leadership of Rev. George Allen, then of Shrewsbury, but for the greater part of his life of Worcester, a convention of eighty ministers of the county was held in Worcester in 1838, which issued a decided declaration against slavery. Two county societies were formed, called respectively the North and South Division Anti-Slavery Societies. In the records of the South Society its first-mentioned meeting bears date February 15, 1838, but evidently other meetings had preceded it. Its president was Thomas W. Ward, of Shrewsbury, with vice-presidents in West Brookfield, Worcester, Millbury, Charlton, Uxbridge and Blackstone. Edward Earle, of Worcester, was secretary, Samuel H. Colton was treasurer, and George Allen, corresponding secretary. Other officers were Effingham L. Capron, Ichabod Washburn, Samuel Waters, Adin Ballou and Jonathan P. Grosvenor. It held quarterly meetings, on Sundays and week-days, in churches, where it could, in public halls, where it must.

The most eminent lecturers spoke throughout the county, among whom were Abby Kelley, Lucy Stone and Stephen S. Foster, of its own residents.

The successive presidents after Mr. Ward were John M. Fiske, of West Brookfield; Samuel May, of Leicester; Effingham L. Capron, of Worcester; and Josiah Henshaw, of West Brookfield. The names of two hundred and sixteen members are recorded.

The North Division did a similar work. Both societies were vigilant, persevering, sparing no party or sect which failed in duty to freedom, and ceased not from their work until the principles for which they were formed had been accepted by the country,

and had become embodied in the National Constitution. It is well to make mention here of these men and organizations, for they were the bold and uncompromising pioneers in the noble work which has resulted in making the whole country free.

Among the anti-slavery men and women of Worcester County, the name of Abby Kelley should have a prominent place. She was born in Pelham, Mass., in 1811; but her parents, descendants of Irish Quakers, removed to Worcester in her infancy. Her education was completed at the Friends' School in Providence, and she was a teacher for several years in Worcester, Millbury and Lynn. She resigned a desirable place in Lynn in 1837 and gave up her cherished hopes of school work, and began lecturing upon the subject of slavery, being the first woman to address mixed audiences in favor of abolition. She was for more than twenty-five years the representative and the voice, to all she could reach, of the enslaved millions in our land. Her earnestness and persistence brought much censure upon her and even harsh accusations, in which churches and pulpits took part. She left her vindication to others, and went on undeterred in her work. In 1845 she was married to Stephen S. Foster, a well-known anti-slavery speaker. They continued their work of lecturing until slavery was no more. Then they lived upon their farm, in Worcester, until Mr. Foster's death, in 1881. Mrs. Foster survived him until January 14, 1887, when she died, honored and respected by all who knew her spirit and life, whether or not they fully agreed with all that she said and did. It was of her that James Russell Lowell wrote :

" No nobler gift of heart and brain,  
No life more white from spot or stain,  
Was e'er on Freedom's altar laid  
Than her's - the simple Quaker maid."

Prominent among the clergymen of the county who were active in these preliminary anti-slavery movements were: Samuel May, of Leicester; George Allen, of Shrewsbury and Worcester; Elnathan Davis, of Ashburnham; and George Trask, of Fitchburg. Mr. Allen was especially active with voice and pen, and Mr. May was one of the most valued contributors to the *Liberator*.

Almost, if not quite, the sole survivor of this determined and faithful band, his benignant presence still graces the home on Leicester Hill, whence, for more than fifty years, he has exerted an influence so pure and important.

Thus Worcester County was disciplined and prepared for the great part it was to play in the final disruption of the old parties, upon both of which slavery leaned; and the establishment of the new, pledged to its limitation, and, ultimately, its extinction. The annexation of Texas, followed immediately, as a consequence, by the war with Mexico, both measures prosecuted by the slave power, were the weights that broke the back of Northern endurance. To both the

sentiment of Worcester County was firmly opposed. Not only the abolitionists, acknowledging fealty to no party, often to no sect or creed, attacked these demonstrations of the slave power with fiery and uncompromising invective, but the respectable, conservative leaders of the Whig party, attached to its principles and its great leaders, were excited to action. On May 6, 1844, a convention, called irrespective of parties, was held in Worcester to protest against the admission of Texas to the sisterhood of States. It was largely attended by representative men from all parts of the county. Hon. John W. Lincoln called it to order. Hon. Solomon Strong, of Leominster, was permanent president; Hon. Joseph Bowman of New Braintree, Rev. Dr. Nelson of Leicester, Hon. Isaac Davis of Worcester, Hon. James Draper of Spencer, Hon. Alexander De Witt of Oxford, and Haskell Powers, Esq., of Warren, were its vice-presidents; Rev. William P. Paine of Holden, William O. Bartlett and William B. Maxwell of Worcester, and Henry A. Delano of New Braintree, were secretaries; Charles Allen of Worcester, Rev. John M. Fiske of New Braintree, John Brooks of Princeton, and Phineas Bemis of Dudley were the committee on resolutions.

The resolutions were reported by Charles Allen. They had no doubtful sound. They denounced the annexation of Texas as in the interest of slavery, and hostile to the principles and sentiments of the North. They were supported by Charles Allen in a speech, declared by the *Spy* "the most successful effort of his life." In the afternoon the discussion was continued, Hon. Emory Washburn, Rev. George Allen, S. M. Burnside, Esq., Rev. S. May, Hon. Abijah Bigelow and Governor Lincoln taking part. The resolutions were then unanimously adopted. Although the speeches were not reported, as in these days, it is impossible to believe, from the names of the disputants and the result, that there was any very declared and apparent division on the subject.

Notwithstanding all opposition, slavery triumphed in the admission of Texas, and in the acquisition of vast territory from Mexico, all of which it sought to control. Not content with this, it demanded a reversal of the old law of freedom and equal terms for slavery in all the territory of the United States. It was in possession of the Government at Washington. Both great parties were fastened to its car. Where was the voice sufficiently potent and the arm sufficiently strong to bid it halt and check its baleful progress? Both were to be found in Worcester County, as proved by the facts to which we now come.

The national election of 1848 approached. The anti-slavery element in the Whig party made a strong effort in Massachusetts to control it, and through its instrumentality to oppose the aggressions of slavery. Those composing this element were styled "Conscience Whigs," in distinction from those who, while sharing in the common sentiment of the State, were

averse to measures which might disrupt the party. Stephen C. Phillips, Charles Francis Adams, Charles Allen and Charles Sumner were among the leaders of the "Conscience Whigs," and Robert C. Winthrop and George Ashmun were the leaders of the others, called "The Cotton Whigs." Daniel Webster, the great leader of the party, its Samson in strength and influence, hesitated between the two. Generally in the country towns the "Conscience" men prevailed, but in the State Conventions they were borne down by the superior weight and discipline of the "Cotton" men from the cities.

The National Whig Convention, for the nomination of President and Vice-President, was called at Philadelphia, June 7, 1848. The Massachusetts State Whig Convention, to choose delegates-at-large to Philadelphia, was called at Springfield, September 29, 1847. The primary caucus of the Whigs of Worcester was held on the evening of September 18th, at the Town-Hall. Chas. Allen presided. It selected fifteen delegates to the State Convention at Springfield, and fifteen delegates to the Worcester County Convention. At this caucus John Milton Earle, editor of the *Spy*, offered a series of resolutions in line with the resolutions previously adopted at the Whig Conventions in Massachusetts in opposition to slavery extension, and representing the often-declared sentiments of the party. Gen. Zachary Taylor, the hero of the Mexican War, was already named as the most available candidate for the Presidential nomination, and the leading Whigs of Worcester, devoted to the fortunes of Daniel Webster, feared the consequences, both to their favorite and their party, of an outspoken declaration on the subject of slavery.

They objected to Mr. Earle's resolutions as unnecessary and out of place in a primary caucus. They admitted their truth, but opposed the policy of their introduction. Col. John W. Lincoln, who had taken a prominent part in the Anti-Texas Convention of May, 1844, said that "actual and undisputed truth should not be spoken at all times." Hon. Rejoice Newton thought that "there was no need of incessant repetition of a string of truisms." John C. B. Davis, son of Senator John Davis, "saw no evidence that the whole South was leagued together in opposition to the North, as claimed by Mr. Earle." Mr. Earle mildly replied that these were "truths that he thought would bear and needed repetition at that time," but his resolutions were tabled. Of the thirty delegates chosen at this convention, but three afterwards followed Judge Allen into the Free-Soil movement. The others remained in the Whig party.

George Ashmun, of Springfield, presided over the State Convention, and Rufus Choate and Seth Sprague were chosen delegates-at-large to the National Convention.

Joseph Bell, of Boston, chairman of the Committee on Resolutions, reported a series of resolutions, the substance of which was the recommendation of Daniel

Webster as the first choice of Massachusetts for the Presidency. John G. Palfrey moved as an additional resolution the following:

*Resolved*, That the Whigs of Massachusetts will support no man for the office of President or Vice-President of the United States but such as are known by their acts or declared opinions to be opposed to the extension of slavery.

Palfrey's resolution was advocated by himself, Charles Francis Adams, Charles Sumner, Charles Allen and Stephen C. Phillips.

It was opposed by Robert C. Winthrop as only a re-statement of the other resolutions, and unnecessary and impolitic. It was tabled, and the resolutions reported by the committee adopted.

April 22, 1848, the caucus of the Whigs of Worcester was held for the selection of delegates to the Fifth District convention, to be held in Worcester, April 27th, to select the district delegates to the Philadelphia convention. Alexander H. Bullock, Henry Chapin, Edward W. Lincoln, John Milton Earle, George Hobbs and John Boyden were chosen delegates to the district convention. C. C. P. Hastings, of Mendon, presided over the district convention, and Henry A. Denny, of Leicester, was its secretary. The same struggle as at Springfield was here renewed, but with a different result. Charles Allen received twenty-eight votes as delegate, and Alexander H. Bullock twenty-one. Charles Allen was then unanimously nominated as delegate, and Alexander H. Bullock as substitute, and the following resolutions, presented by Freeman Walker, of North Brookfield, were unanimously adopted:

*Resolved*, That in addition to the former issues between the Whig Party and their opponents, we recognize as another and most important one, our uncompromising opposition to any further extension of slavery over any territory of the United States, or to any legislation by the National Government the specific object of which is to sustain the institution of slavery.

*Resolved*, That in the opinion of this convention no candidate for the Presidency can receive the electoral vote of Massachusetts who is not publicly known to be opposed to the extension of slavery over territory now free.

The voice of Massachusetts might be stifled, but the voice of Worcester County must be heard.

The Whig National Convention of 1848 met at Philadelphia, June 7th. John M. Moorehead, of North Carolina, presided. The policy of non-commitment on the slavery question, and of availability in the selection of candidates, prevailed. General Zachary Taylor was nominated for President on the fourth ballot, and Millard Fillmore, of New York, was nominated for Vice-President on the second ballot, over Abbott Lawrence, of Massachusetts. No platform of principles was adopted.

When the result of the convention was manifest, Mr. Allen, of Massachusetts, arose to address the convention. He spoke amid great confusion, and cries of "Sit down!" "Order!" "Knock him down!" "Go on!" "Sit down!" "Let him go on!" and cheers and hisses. He demanded to be heard, saying, "I doubt not but what a convention of free

Whigs will listen for a moment to the voice of a free Whig State, represented in that convention. That voice is from Massachusetts. I think I know something of the feelings of that State. I express for myself what I believe to be the sentiments of that State, and I say that we cannot consent that this shall go forth as the unanimous voice of this convention. The Whig party of the North are not to be allowed to nominate their statesman. We declare the Whig party of the Union this day dissolved." Judge Allen's voice was here drowned by cheers and hisses and cries, "Let the North answer him!" "Let Massachusetts answer him!" "There is better Whigism there than that." Cries for "Choate," "Choate," "Choate," were heard from all sides, and especially from Southern members.

Mr. Allen claimed the right to proceed, but the president ruled him out of order. Mr. Allen then moved to suspend the order of the day. The motion was lost by a large majority. He appealed from the decision of the chair and demanded to be heard on his appeal. Again he was ruled out of order. Mr. George Ashmun, of Massachusetts, got the floor. He withdrew the name of Mr. Winthrop as candidate for Vice-President in favor of Mr. Lawrence, and then referred to Mr. Allen as follows: "My colleague has stated that Massachusetts will repudiate the nomination. Such is not the case. My colleague has only expressed his own sentiments and not the sentiments of the Whigs of the 'Old Bay State.'" Mr. Lunt, of Newburyport, sought to appease the indignation of the Southern delegates. He said: "Mr. President, I have listened with great pain, and sometimes I may say with indignation, to some of the sentiments spoken by my colleague of the Massachusetts delegation. I have chosen to aid in making this nomination, and intend to sustain it with my whole heart and soul. I would cheerfully sustain any other true Whig, as I believe the nominee to be. The gentleman spoke only for himself on this floor, and, sir, in some degree he will find that he speaks only for himself in Massachusetts. And, sir, although it is difficult to predict the result of an election, yet, in my estimation, the nominees of this convention will receive a decided majority of the votes of Massachusetts."

Mr. Allen again demanded to be heard, and failing in his effort, he declared he would not be bound by the proceedings of the convention.

Mr. Wilson, of Natick, came powerfully to the aid of Judge Allen, repeating his declaration that he would not be bound by the action of the convention.

June 9th the *Daily Spy* (for a few months issued under the name of the *Daily Transcript*) closes a non-committal article on the nomination as follows: "By remaining true to our faith we shall stand in a position when, at the earliest possible time, we can make our influence for good felt and appreciated, but if we desert it (the Whig party) where shall we go to,

or where find ourselves? Echo solemnly answers where. Let us heed the inquiry."

This recognizes the fact that at that moment there was no party into which the outraged Whigs could go from their own.

June 12th the *Spy* admitted a communication outspoken in opposition to the nomination of Taylor guarding its own position by the statement that "All the Whigs should have the opportunity of being heard. We have therefore admitted the following communication, and our columns are equally open to others, whatever their views, upon the subject."

June 14th the *Spy* said: "Greatly as we are disappointed and humiliated by the nomination (of Taylor and Fillmore), we shall not be driven thereby from our support of Whig principles, Whig measures and Whig men. We believe that General Taylor will be elected. If elected, it will be as the Whig nominee, and with such a union as may be maintained without any sacrifice of principles. The election of President will carry with it the election of members of Congress. Opponents of slave extension and slave legislation have it in their power to give potency to their principles in that election. If they are wise and prudent, will they not do so?"

It copies, in the same issue, from an article of the day before in the *New York Tribune*, in the same tone, closing as follows: "If the developments of the next few days shall prove that the free States are now ripe for the uprising, which must come sooner or later, then we are ready. Our present impression is that the time has not quite arrived, but we shall see." No such lame and halting counsel as that of these papers thus expressed called into existence the party which led or caused "the uprising," before which the slave power, thus strongly entrenched in both Whig and Democratic parties, met its fate.

Charles Allen had not spoken. He was biding his time.

June 16th we find in the *Spy* a communication closing as follows: "Let every Whig be faithful. It is better for a starving man to eat half a loaf than to die, and so it is better to elect a Southern Whig than to submit to the destructive measures of a Northern Loco-foco, especially one pledged to continue, if elected, in the track of so honorable a predecessor as James K. Polk."

June 12th George Ashmun published an eloquent appeal to the Whigs of Massachusetts to stand firm for Taylor and Fillmore and the Whig party, concluding with the famous words of Daniel Webster, "In the dark and troubled night that is upon us I see no star above the horizon promising light to guide us but the intelligent, patriotic United Whig party of the United States."

June 16th a great ratification meeting for the nomination of Taylor and Fillmore was held in Boston, and addressed by Rufus Choate, George Lunt and others.

Worcester County still kept silent.

But in the *Spy* of June 21st two notices appear in parallel columns, one, with no signature, reading thus: "The citizens of Worcester and vicinity, opposed to the nomination of Taylor and Cass, are invited to meet at City Hall Wednesday evening, June 21st, at 7.30, and make arrangements for the approaching convention to be held on the 28th inst."

"Hon. Charles Allen, a delegate to the late Philadelphia convention, has been invited, and has consented to address the convention."

"All friends of the proposed movement from neighboring towns are cordially invited to be present."

Immediately following is the notice of a mass convention of Whigs, Democrats and Liberty men from all parts of the Commonwealth without distinction of party, "to be held in the City Hall of Worcester on Thursday, June 28th, to unite in support of that sacred principle which will be violated by the election of either Cass or Taylor—freedom in free territories." This notice is also without signature. On the opposite column is the notice of a meeting to ratify the nomination of Taylor and Fillmore to be held at the City Hall in Worcester, Saturday evening, June 24th, signed by one hundred and fifty of the leading citizens of Worcester, whose names, until then, had represented the opinions and the policy of the city. The issue was joined.

Would Worcester sustain Charles Allen, its delegate to the Philadelphia convention, in his proud and defiant statement that the Whig party was dissolved? Or would it follow the one hundred and fifty, to whom it had been accustomed to look for leadership and guidance, in sustaining that Whig party to which its allegiance had been so long and unwaveringly given? It was aided by no advice from the *Daily Spy*, which had always been the organ of the Whig majority. In its editorial column it refers its readers with absolute impartiality to the notices of the political meetings to be holden in the city. It advises all "to go and hear both sides, and then every man decide for himself, according to original principles, without reference to the course of others," and adds, "We trust that any attempt to browbeat or intimidate may be met as it deserves."

The Worcester City Hall was packed that evening as it had seldom, if ever, been before.

No meeting was ever more spontaneous in its character and action. It was really the idea of a half-dozen gentlemen, of whom Mr. H. H. Chamberlain was the chief. They postponed the call on account of the delay of Judge Allen on his journey home from Philadelphia. Whether he delayed for the purpose of waiting to know what would be the impression upon his district by his action at Philadelphia, or for what reason, is not known. He, however, came through New York, tarrying on his way and did not

reach his home until about ten days after the convention. Mr. Chamberlain immediately called upon him, to congratulate him upon his action in the convention. He also expressed his own desire, in which he doubted not that others concurred, to hear a report from Judge Allen as soon as convenient. The judge responded that he would speak if Mr. Chamberlain thought there would be any one to listen to him.

After consultations with the half-dozen gentlemen whom he represented, Mr. Chamberlain called again and formally invited Judge Allen to make a speech, although he said to him that perhaps they should think it best to have it delivered in a small hall. Upon inquiry, however, it was decided to engage the City Hall, then the largest in the city. At the hour of the meeting Mr. Chamberlain waited upon Mr. Allen from his residence to the hall. As they approached the entrance he was surprised to see a crowd about the door. His first thought was that so few had assembled that they had not thought it best to go in to take their seats, but were waiting on the outside. But he soon found that the hall and stairways were densely packed, even back to the sidewalk, and it was with difficulty that he was able to make a passage through by which he could conduct Judge Allen to the speaker's stand.

An hour before it had not been known who would preside over the meeting. The great men of the city were not there, nor in sympathy with it. The press had not advocated it. The clergymen were cold. The merchants and professional men passed it by. But the men from the shops, who were really rulers of the city then as they have been ever since, were there to express their sovereign will. They realized the importance of the crisis, and disregarding the wishes and advice of those to whom they had been accustomed to trust the management of their political interests, they had resolved to take matters into their own hands, and had come out to do their work themselves.

Careful perusal of the *Daily Spy* of the next morning fails to discover any allusion to the proceedings of that meeting; and yet of all meetings ever held in that ancient and famous building, this was the most important and the most far-reaching in results. That night witnessed the birth of the Free Soil party, which sprang full-armed from the brain and will of Charles Allen, ready to do battle for human freedom against Whigs, Democrats and all other opponents.

The meeting was called to order by Oliver Harrington, and was organized by the choice of Albert Tolman as president and William A. Wallace as secretary. Albert Tolman was a representative mechanic, not then very widely known, but thoroughly respected by all who did know him. William A. Wallace was in the employ of the *Spy*.

Scores of the one hundred and fifty signers for the Taylor ratification meeting stood higher in political and social influence and wealth than they, and yet,

none of those ever occupied so high a place as these comparatively humble men on that night, or did a deed so significant and far-reaching in its meaning as did they.

Oliver Harrington, George W. Russell, Henry H. Chamberlain, Edward Southwick and Joseph Boyden were appointed a committee to nominate a list of names of persons to act as a Committee of Arrangements for the convention to be held at Worcester on the 28th instant. A committee of thirty-two was nominated and appointed after this business. Hon. Charles Allen entered the hall, and the loud and long continued applause with which he was received by the assembled multitude indicated what was to be the verdict on his course. He was then in the prime of his manhood. He had broken away from the party which he had honored and which had honored him up to that time. He knew that he stood aloof from Governors and Senators, and from the leading citizens of Worcester, with whom he had always acted, but his hand was upon the heart of the Commonwealth, and its beatings responded firmly and truly to his touch. Until that night he had been a leading, but not indisputably the leading, member of the county bar. He had filled many places of trust, and always well, but many citizens of Worcester had filled higher as well. Others might equal or excel him in many respects, but no man ever had a more fearless courage or sublimer self-reliance. He did not stop to ask who or how many were with him. He spoke his own sentiments and convictions, and in doing so he spoke for the great majority of his city and county. He admitted in his speech that he did not expect to be sustained so completely." He had confidence in the integrity of the people of his district, and knew that some time he should come out all right. The people of his district did not allow him to remain long in ignorance of their position. Where he was ready to lead, they were at once ready to follow.

On June 23d the *Spy* gave an appreciative notice of the meeting, signed "William A. Wallace, Secretary." No comment was made in the editorial columns. It printed Judge Allen's speech in full, as it was reported by Dr. Stone, of Boston, one of the earliest and most accomplished of the stenographic reporters of the State.

It occupied nearly two hours in its delivery. In style it is a masterpiece. In its adaptation to the occasion of its delivery, in its power to produce the results desired by the speaker, it was scarcely, if ever, surpassed or equaled. He reviewed his life-long connection with the Whig party and the action at the convention in which he was selected delegate of this district in the National Convention. He referred to the resolutions of that convention as charging him to "vote for a candidate for President who should be in favor of preserving the territories of the United States free from the stain of Slavery." He said

proudly and confidently: "I believe, gentlemen, it was a most deliberate and well considered act on the part of the District Convention, and I believe I was selected as the delegate because my sentiments were well known upon this subject. Had the convention intended to put forth principles upon which they did not mean to stand and abide, surely they would have sent some other man as their delegate, for they knew my opinions too well. They have been too uniform upon the subject to leave a doubt that I would carry out these sentiments to the letter, and not only to the letter, but in their spirit." He reviewed the circumstances in reference to Gen. Taylor's candidacy, and declared that the men of the South, in selecting him as their candidate, knew well what they were doing, and that they would support him at the polls, and squarely and defiantly answered them for the North in these uncompromising words: "We reject Gen. Taylor throughout the North and throughout the free States. We reject him, and mean to reject him, at the polls, because he is not known to be a Whig and because he is well understood to be hostile to the great principles of freedom." He disclosed to his constituents a little of the secret history of the nomination as follows: The inquiry was put around to the delegates of Massachusetts for the purpose of getting information "if Gen. Taylor is nominated will your District support him?" and when they came round to me I said, "No, gentlemen, my District will not support him." Up starts pert Mr. Lunt, and says: "There are men in your District who do not think as you do upon that subject." I said, "Sir, who said so? I must know who takes that responsibility." "Governor Lincoln," was the reply. "Not by him only, but by others" was it reported that there was a strong sentiment here for Gen. Taylor, and that the County of Worcester would go strongly in his favor. Am I right, or was he?" No one present in that meeting will ever forget the proud and defiant face and form of Judge Allen as he uttered this challenge against the man who held the first place in the respect and regard of the citizens of Worcester, and who was then occupying its mayor's chair in the first year of its existence as a city as the first and most popular citizen of the new-born municipality. The ring of Ivanhoe's spear-point upon the Templar's shield was not truer or bolder. No one present will forget the deafening shout with which the vast crowd endorsed the bold and self-reliant man who stood before them. Gathering boldness from his reception, he next referred to the great man who had so long been the leader and the idol of the Whigs in Massachusetts, Daniel Webster. He declared that Mr. Webster had been opposed to the nomination of Gen. Taylor, and said: "He was right, he was earnest in his condemnation. May God grant, gentlemen, that he may continue so, and if His Providence prevented him from uttering sentiments which would do him no

honor at Baltimore yesterday, may His Providence still watch over him. For I do not wish to see that strong man grinding in the prison-house of the Philistines. . . ." The immense applause showed that the mighty blow had stricken from its place the idol which so long had held the first place in the worship of that audience.

Governor Davis, then Senator of the United States, ex-Governor of the Commonwealth, was referred to as having written a cordial letter favoring General Taylor, and again Mr. Allen was cheered to the echo; and then he clinched his charges. "If Governor Davis denies that I have spoken the truth of him, I will prove it. If Governor Lincoln denies that I have spoken the truth of him, I will prove it. Most of us have belonged to the Whig party. We have professed to be averse to the extension of slavery. The question is not here whether we would eradicate it where it exists, but we are opposed to its extension. Well, gentlemen, I did not eat my words at Philadelphia. Will you at the polls? When I declared that the Whig party was dissolved, I declared a fact. The undertaker may preserve the corpse for a little time, but it will soon be offensive to the smell and the sight, and must be removed from the sight of the people."

The truth of this prophecy has since been made manifest. General Taylor was elected at the polls, but it was the last victory of the Whig party, which then passed forever from the platform of action into the records of history, "*dissolved*" into thin air, "leaving not a rack behind."

Sure of the sympathy of the vast audience before him, he told them that they "must not believe all that they read in the newspapers. They will not see that this feeling of dissatisfaction exists throughout Massachusetts. It will be said in Boston that there is no feeling in Worcester, except for Taylor. Not a man, except the crazy one that went to Philadelphia, opposes him, and papers will send the news to Ohio, and the Ohio newspapers will respond, but we shall have a voice from Ohio. There is one paper in Boston (the *Whig*) which will tell you what Massachusetts is doing and what Ohio is doing, and I hope the *Massachusetts Spy* will also tell the people. I hope our friend of the *Spy* will see that there is something more than a shower coming. I hope he will see that his true interest is in boldly speaking out his principles, and let him be the organ here of what is most emphatically the people's party, sprung from the people, sustained by the people, and he himself will be sustained also. But, gentlemen, organs we must have, and we cannot wait many days for them. We cannot wait and see our principles defamed and our men cut down without presses that will stand up and fearlessly vindicate the right, and receive communications without cutting off all that is valuable in them," and, turning to Mr. John Milton Earle, editor of the *Spy*, who was sitting in front of him, he added, "The

editor knows I do not wish to injure his paper, but help it, and I wish him to look on the faces of these men, and to let him know there are more of the same sort, and let him see that the line of duty and the line of safety coincide." He appealed to Massachusetts to act even if she acted alone, but he said "this agitation is more extensive than is supposed." He declared that a convention would be held in New York and also in Ohio. He said "most of the young men of Worcester, who are accustomed to speak in political meetings, are on the wrong side of the question. We hope that they will soon be—and the elderly, too—on the right side. As they value their political safety, let them ground their arms, and, with penitent submission to the spirit of Liberty, let them go forth and show by acts that their repentance is sincere."

He hoped that "the young men who speak in Lyceums will take up the matter and send the young men of the city back with defeat when they go to preach their nauseous doctrine in the ears of the people of Worcester County. Let them meet them and refute them, and send them back ashamed of their work. When the fathers go to whom is given the charge of Worcester County I will endeavor to be there or to follow them." He closed by referring to Henry Wilson, a young man who had been a delegate to the Philadelphia Convention from Middlesex District, and whom he introduced to the meeting.

Henry Wilson, then known as the "Natick cobbler," arose in his seat to make his first of many speeches in the Worcester City Hall. Rough, awkward, enveloped from head to foot in a brown linen duster, he spoke a few eloquent words in support of his case and that of Judge Allen.

As he closed, an earnest form made its way to the desk, and with flashing eye and earnest voice uttered *memoriter* the immortal resolution: "*Resolved*, that Massachusetts wears no chains and spurs all bribes; that Massachusetts goes now and will ever go for free soil and free men, for free lips and a free press, for a free land and a free world."

This resolution, copied with the other resolutions adopted by the meeting, has since been claimed as written by another person. But no man present at that meeting will ever forget that its author was George Allen, brother of Charles Allen, the orator of the evening. It was adopted with shouts and the great meeting adjourned and its thousands poured out into the communities whence they came, devoted missionaries of the cause of free soil and free men.

The Free-Soil party was born that night in the City Hall of Worcester. Its author (?) was Charles Allen, and it was christened by his brother, George Allen, the veteran champion of anti-slavery in the county.

John S. C. Knowlton, the able Democratic editor of the *Worcester Palladium*, in his paper of November 8, 1848, referring to the great activity put forth by the Free-Soilers in the city and surrounding towns,

wrote: "This is as it should be, for in Worcester County was the first organized resistance to the nomination of Zachary Taylor as the Whig candidate for President." The editor of the *Palladium* was correct. Others objected to the nomination and expostulated against it at Philadelphia, but Judge Allen threw down the gauntlet of uncompromising combat, and declared the great party dissolved. There were other anti-slavery champions and organizations engaged in movements, having for their object more or less extreme opposition to the aggressions of slavery, but these were of local or personal character.

In New Hampshire John P. Hale, ostracized by the Democratic party in 1844 because of his opposition to the annexation of Texas, had been waging, since then, a sturdy fight against that party in New Hampshire. Mr. Hale was a born politician. Deprived of his seat in Congress by the Democratic party of the State, of which he had been a prominent member, he immediately offered himself as a candidate to the State Legislature, to which he was elected and from which he was sent in 1846 to the Senate of the United States. Never was there an abler, more eloquent and faithful defender of Northern principles. But he was not the man to found a party. Inflexibly true to his principles, he had not the same solemn and determined earnestness as had Allen, and Sumner, and Phillips, the anti-slavery leaders in Massachusetts. No man ever waged battle in the United States Senate against greater odds, or more bitter foes, or with greater personal success. He never hesitated to enter into such contests, from which he seldom came out second best, but he always fought where strife was thickest and blows the heaviest with a smile on his face and a jest on his lips. He will always be remembered as the great anti-slavery Senator who stood alone in the United States Senate for years, sustaining the struggle single-handed, until he had the satisfaction of finding himself in a majority in the Senate where he had so bravely and ably stood alone. But he was not the founder of the Free-Soil party, nor did it have its origin in New Hampshire.

In Ohio, since 1840, the Liberty men had maintained an organization of a few thousand voters. There was a strong anti-slavery feeling in Ohio. Salmon P. Chase, a man of great ability and equal ambition, had taken a position somewhat independent of party, always sustaining anti-slavery principles. He was a Democrat, and believed, though with many doubts, that through the agency of that party redemption from slavery would come at last, as did the Conscience Whig leaders in Massachusetts believe that it would come through the Whig party. Mr. Chase was undoubtedly ready to enter into a new party based on anti-slavery, but he did not organize that party. He waited for the movement in Massachusetts. In the fall of 1847 he attended the National Convention of Liberty Men, at Buffalo, to nominate candidates for

President and Vice-President, as the same party had done twice before. He opposed the nomination of candidates, on the ground that before the election of 1848 there would be a change in the aspect of political affairs, which would demand different action than that proposed by the Liberty party, of which he considered himself a member. The convention, however, did not act as advised, but proceeded to nominate John P. Hale for President, and Leicester King for Vice-President. These nominations were withdrawn after the Free Soil nominations were made in 1848. Mr. Chase was influential in issuing a call for a people's convention, to be holden on the 21st of June, 1848, at Columbus. This was the very day on which Judge Allen spoke in Worcester. This call was addressed to anti-slavery men, "To resist by all constitutional means the extension of slavery into territories hereafter acquired." It concludes: "We ask no man to leave his party, or surrender his party views, but we do ask every man who loves his country to be ready, if need be, to suspend for a time the ordinary party contentions, and unite in one manful, earnest, victorious effort for the holy cause of freedom, free territories and free labor. We, therefore, invite the electors of Ohio, friends of freedom, free territories and free labor, without distinction, to meet in mass convention for the purpose of considering the political condition of our country, and taking such action as the exigencies of the time may require, and may God defend the right." In 1849 Mr. Chase was elected to the United States Senate by the Democratic party of Ohio, and stated that while he intended to act in opposition to all pro-slavery measures in all respects, he was a Democrat, and should act in other respects with the Democratic party. We do not find the source of the Free Soil movement in Ohio, nor was Mr. Chase its founder.

In New York there was a movement in the Democratic party in opposition to the election of Cass, the nominee for the Presidency of the Democratic Convention, but this movement was in obedience to the wishes of Martin Van Buren, to gratify his revenge upon the party which had displaced him as its leader and put General Cass in his place. One would smile now at the claim that the Free-Soil movement had its origin among the Barn-burners of New York, and that Martin Van Buren was its author and constructor.

When we come to Massachusetts we find that the Conscience Whigs were standing in order for the summons to organize against the victorious faction which had so thoroughly triumphed over them in the Philadelphia convention. The leaders had undoubtedly held consultations, accidental and informal, in Boston, and had proposed the calling of a mass convention, to be held in Worcester, somewhat similar to the mass convention held in Ohio under the auspices of Mr. Chase. Undoubtedly all these movements, more or less defined, nearly cotemporaneous in

time, concurred in the great movement, which had its beginning in 1848, and continued until the great and final victory in the election of Lincoln in 1860.

As different explorers and geographers contend that the great Mississippi River has its origin in this or that lake, or mountain source, each jealous for his own locality, so the men of Ohio, and of New York, and of Boston even, may contend that the mighty party which conquered slavery and made the Republic free and undivided had its origin in Columbus, or Buffalo, or Boston, with this or that putative father or author. The facts prove that it had its origin in Worcester County, and that Charles Allen was its founder and leader.

The meeting of June 21st, at which Judge Allen's great speech was made, chose a committee of twenty-six to take measures in regard to holding a mass convention in the city of Worcester. Charles Allen's name stands at the head of this committee. In the *Spy* of June 26th this committee issued its call. This call reads as follows:

"The undersigned, as a committee of a large and enthusiastic meeting of the citizens of Worcester and its vicinity, and in conformity to their instructions, do hereby earnestly call on the citizens of Massachusetts, without respect to party, to meet in this city, at the City Hall, on Wednesday, the 28th inst., at ten o'clock A.M., to express their sentiments and to adopt measures in favor of free territory and against all nominations for President of the United States of individuals who refuse to declare their opposition to the extension of slavery over the territory recently acquired, or which may hereafter be annexed to the Union."

On the evening of June 21st the first organization was effected, and the first act of this organization was the call for this mass convention, to be held at Worcester, June 28th. On that day the convention assembled, composed of earnest and determined men from every section of the Old Bay State. It was a solemn and eventful gathering. Most of these men had been members of the great Whig party, long paramount in Massachusetts, under the lead of the greatest of American statesmen, at least of that generation, Daniel Webster. They had broken away from their party. They had turned their backs upon their great leader, although they still vainly hoped that he might not array himself against them. They had undertaken to organize and build up a new party in opposition to the old parties, for the purpose of bringing the National Government into accord with the declarations upon which it was based, and with the principles and policy of the men who founded it. It was a great undertaking, and they were great men who entered upon it. On one of the most beautiful days of the beautiful month of June they gathered around the City Hall of Worcester some eight thousand strong. The meeting was organized in the morning in the City Hall. The venerable Samuel

Hoar was chosen its president; vice-presidents and secretaries were chosen. But the hall was too small to accommodate the large and enthusiastic multitude. The meeting was adjourned, first to the Common, and thence, for the afternoon session, to the grove on the hill, near where the Normal School now stands.

Directly after its organization in the morning, Mr. Phillips, of Salem, chairman of the committee on resolutions, stated that the committee was ready to report in part, and reported the following resolution, which was adopted by acclamation:

*Resolved*, That this convention tenders to Charles Allen and Henry Wilson the warmest thanks for the fidelity, consistency, decision and boldness with which they performed their duty as delegates from Massachusetts to the National Whig Convention; that this convention hereby ratifies their acts, and assures them confidently that their services will be held in grateful and proud remembrance by the people of Massachusetts.

Charles Allen was then introduced amid cheers and plaudits. He declared that Taylorism was dead in Worcester County, and reaffirmed the statements which he had previously made respecting "the stupendous fraud of the Philadelphia convention." Hon. Henry Wilson then spoke with much animation, and was received with great applause. He closed with saying, "It was said that the Whig Party must be purified from abolitionism. I would like to see the Whig Party after such a separation." He did live to see the Whig party after the separation, and until it dwindled to an infinitesimal and imperceptible point.

Amasa Walker, of North Brookfield, spoke in a similar strain, and the old liberty editor, Joshua Leavitt, of Newton, followed him. In the afternoon Lewis D. Campbell, of Ohio, who had sided with Allen and Wilson in the Philadelphia Convention in a certain degree, made a speech. His speech was characterized by the engaging and pleasing eloquence for which Ohio was distinguished then, as well as now. He said he "did not come to the convention to identify himself with any political movement. He was going to return to Ohio and place in the hands of his constituents the glorious flag which they entrusted to him when he left the Miami, and he should then take his position, and it would be right." Had Mr. Campbell been more of a leader and less of an orator he might have attained a higher position and left a more positive record than he did.

Stephen C. Phillips, of Salem, followed with an address and with a series of resolutions, which were unanimously adopted.

George Allen's resolution, quoted above, was the most attractive gem in the platform.

Mr. Giddings, of Ohio, the fearless and uncompromising member of Congress who represented at that time more than any other one man the convictions of opponents of slavery, and their determination that it should be checked at once, briefly addressed the audience. In the evening the hall was again packed. Mr. Giddings concluded his speech. Mr. Lovejoy of

Cambridge, Charles Francis Adams of Boston, Charles Sumner of Boston, and E. Rockwood Hoar of Concord, addressed the convention, after which the Hutchinson family, the sweet singers of the anti-slavery cause, gave a song, and the convention adjourned. It selected a State central committee, of which Freeman Walker, of North Brookfield, and Alexander De Witt, of Oxford, were the members from Worcester County. The battle was set.

The Whigs accepted Judge Allen's challenge, and met in the City Hall Saturday evening, June 24th. Their leaders were there. Judge Barton presided over the meeting. It was not perfectly quiet or wholly satisfactory to those who called it. When Judge Barton had stated the charges made against the Whig party and summed them up, he addressed the audience: "Gentlemen of the Jury, what say you, was the Philadelphia Convention guilty or not guilty?" And the shout of "guilty!" from all parts of the hall was the quick and determined, though unwelcome, answer that was given him. The stately Governor Lincoln reminded the people of the object of the meeting, which was to ratify the Whig nominations, and intimated that any attempt to disturb it might cause future retaliation. He apologized for not making a speech then, but said he would do so upon some future occasion. He introduced to the audience General Leslie Coombs, of Kentucky, "The ever true friend and neighbor of Henry Clay." The audience could not be otherwise than in good humor with this witty and eloquent Western orator.

Col. Alexander H. Bullock read a long series of resolutions in favor of the nominations of Taylor and Fillmore.

The chairman put the question on the adoption of the resolutions and unfortunately called for the noes, and was met with a thundering response. The meeting then adjourned amid cheers for Zach. Taylor drowned with cheers for Charles Allen.

The character of this meeting may be inferred from the comments found in the *Palladium* and the *Spy*. In the *Palladium* it was referred to as "a meeting called a ratification meeting. Had it not been so called it would have been thought to be anything else."

In the *Spy* the enthusiastic Wallace gave jubilant utterance to his feelings at the end of his report of the meeting: "God bless Old Massachusetts! Though the sky of freedom shall fall all around her she will not falter; her invincible hearts will still hold it up, till other days and better times shall make her principles triumphant."

The Free Soil party, under the lead of Alexander De Witt of the State Committee, immediately proceeded to open and prosecute the county canvass. Meetings were called in all the towns, and even in the school districts of the town Freedom Clubs were organized. Seven hundred joined in Worcester at its first meeting.

Edward Hamilton was chosen its president. He was of an old Worcester family, with physical and mental qualifications equal to any position, but he early turned aside from the path of ambition, which he might have successfully followed, to gratify his great love of literature and art. His speech on assuming the presidency of the Freedom Club showed his power and capacity. Charles White, who afterwards developed into the ablest political organizer known in Worcester County, was on the executive committee of the Freedom Club.

The young men who were accustomed to speak in the lyceums responded to the call of Charles Allen, and the numerous meetings did not lack for speakers. Charles Allen spoke in the larger towns. Alexander De Witt, Amasa Walker, Dr. Darling, John W. Wetherell and William B. Maxwell, of Worcester, made numerous speeches. Charles Sumner spoke in Fitchburg and Worcester. On the evening of November 4th he delivered a great oration in the City Hall, which may be found in his works—one of the long and illustrious series which placed his name at the head of the orators of freedom, and at the same time drew upon him the hatred of the slave-power, of which he became the victim. His eloquence was of a loftier and more labored strain than that of Charles Allen, but while its effect was great, none of his orations in Worcester equaled that delivered by Charles Allen on the night of June 21st.

The Whigs also held numerous meetings in the towns and in the city. Their orators were more cultured than those of the Free Soil party. Among them was Judge B. F. Thomas, gifted with a natural eloquence unequaled by any of his contemporaries, and Alexander H. Bullock, the grace and beauty of whose oratory is still the pride of the city and county; but they were contending not in an intellectual and rhetorical struggle, but in a moral contest, in which the hearts of the people were against them.

On the evening of November 6th Daniel Webster, who, with broken heart and bowed head, obeyed the mandate of his old party, and, notwithstanding the wrongs which he had received from it, still helped its cause with his mighty eloquence, spoke in advocacy of the election of Taylor and Fillmore in the City Hall. The meeting was presided over by Gov. Lincoln. The audience was great, and listened to the declining statesman with respect and admiration mingled with sorrow and sympathy. But at the same hour thousands of the citizens of Worcester and adjoining towns filled the streets of the city with a procession, with bands, banners and torchlights, longer and more brilliant than the city had ever witnessed before. As at many other times and occasions, the torchlight procession was more impressive and effective than the speech of the statesman. The buildings were illuminated as it wound its way, amid cheers and applause, to its rendezvous at Lincoln Square, where all who could, found entrance to a building then re-

cently erected, occupied partly as a station for the Nashua Railroad Company, but afterwards, and for many years, as the boot factory of Joseph Walker. There the popular young lawyer, Henry Chapin, who had recently come from Uxbridge, made his maiden speech for Free Soil. He had been the chairman of the Whig County Committee, and was regarded as one of its most popular and promising young men.

When some grumbler had published a criticism upon his conduct in not issuing an early call for a meeting of the Whig Committee, Mr. Chapin responded with a card in the paper that he would call the meeting at a sufficiently early day, and advised his dissatisfied friend to attend, as there would be plenty of vacancies on the committee, to some one of which he might possibly be elected. The Free Soilers the next year elected him by an overwhelming majority to fill the mayor's chair.

On the next Monday, November 8th, the election, looked forward to so long and so anxiously, occurred.

Charles Allen had been unanimously nominated for Congress at the Free Soil Convention. Charles Hudson, the conservative, experienced and able incumbent, had been renominated by the Whigs, and Isaac Davis was the candidate for the Democrats. The city of Worcester cast for Charles Allen 1489 votes, for Charles Hudson 589, for Isaac Davis 284. The entire district gave for Allen 6604 votes, for Hudson 4808, for Davis 3087. As a majority was requisite for election, it was not until the third trial, in January, that Allen was elected to fill the seat from which the worthy and highly respected Hudson was displaced. Of the fifty Free Soil Representatives elected to the Massachusetts Legislature, twenty were from Worcester County. Of the 38,133 votes given for the Free Soil candidate for President and Vice-President, Worcester County gave 8654 to 5990 given for Taylor and Fillmore. Such was the verdict that she rendered as between freedom and slavery. She fired the signal gun in 1848 of the great battle that ended at Appomattox in 1865.

She kept Charles Allen in Congress during two terms, which was as long as he was willing to remain, after which Alexander De Witt succeeded him. Excepting during the Know-Nothing frolic, she has remained true to the faith then adopted until the present. The Know-Nothing movement was really a part of the great revolution, having for its object, and ending in, the overthrow of slavery.

The men who took part in these early conflicts have, most of them, ceased from their earthly labors, but their works survive to vindicate their wisdom and faithfulness. If some of their names are preserved, and some of their deeds are commemorated in this brief sketch, written by one who began his political life in their ranks, and learned from them principles and practice which he has always en-

deavored to maintain, its purpose is abundantly fulfilled.

## CHAPTER CCII.

### WORCESTER—(*Continued.*)

#### THE SETTLEMENT OF KANSAS.

BY EDWARD EVERETT HALE, D.D.

THE movement by which the State of Kansas was settled under the influence of organized emigration, began in the forethought and energy of a citizen of Worcester. Many of the details of that movement belong in the history of the city and county.

The act throwing open to emigration the Territories of Kansas and Nebraska repealed what was known as the Missouri Compromise. This "Compromise" was the act of 1820, in which the Southern States, with the assistance of indifferent partisans from the Middle States, had provided that the State of Missouri, and all States henceforward to be formed south of the parallel which is its southern line, might be open to the institution of slavery, but that north of that line the Territories should always be free, as had been the Northwestern Territory, under the ordinance of 1787. After very strong protest at the time, the "Compromise" was acquiesced in by everybody. In later days it has been decided by the Supreme Court to have been unconstitutional.

This compromise-line, established under the protest of the Northern States, and in face of the votes of most of them, was now set aside. It was evident, after February in 1854, that the act opening Kansas and Nebraska to settlement would include a proviso, introduced by Mr. Douglas, of Illinois, that the institutions of each State should be determined by the votes of the first settlers. This system was familiarly known as "Squatter Sovereignty."

The Southern heads of the Government absolutely directed Congress and the administration of General Pierce. Their determination to abolish the anti-slavery provision of the "Compromise" aroused the indignation of all persons in the Northern States who were not bigoted partisans, and put it in the power of men of all shades of opinion to act together.

Worcester was represented in the General Court at that time by Mr. Eli Thayer, who was then at the head of the Oread Institute, which has been described in another chapter of this book. He saw at once that, under the "squatter sovereignty" provision, the North had it in its power to work its will. And Mr. Thayer did not make the great mistake of supposing that separate emigrants, not supported by the public opinion of those around them, could achieve anything. He devised a plan for the organization of emigration, which, in a series of years, without the

slightest change in the principles which he had laid down at the very first, proved remarkably successful. Before the "Nebraska Bill," as it was universally called, had passed Congress, Mr. Thayer announced his plan. In a public meeting held in Worcester on the 11th of March, to protest against the repeal of the Missouri Compromise, Mr. Thayer brought forward this practical proposal. The conclusion of his speech was in these words:

It is time now to think of what is to be done in the event of the passage of the Kansas-Nebraska Bill. Now is the time to organize an opposition that will utterly defeat the schemes of the selfish men who misrepresent the nation at Washington. Let every effort be made, and every appliance be brought to bear, to fill up that vast and fertile territory with free men—with men who hate slavery, and who will drive the hideous thing from the broad and beautiful plains where they go to raise their free homes. (Cheers.)

I, for one, am willing to be taxed one-fourth of my time or of my earnings, until this be done—until a barrier of free hearts and strong hands shall be built around the land our fathers consecrated to freedom, to be her heritage forever. (Loud cheers.)

Mr. Thayer himself says of this: "If, instead of this impetuous, spontaneous and enthusiastic response, there had only been a moderate approbation of the plan, you would never have heard of the Emigrant Aid Company. The citizens of Worcester were sponsors at its baptism, and upon their judgment I implicitly relied, and I was not deceived."

We have this reason for saying that to the people of this city, and especially to Mr. Thayer, who acted as their leader from the beginning to the end in this matter, is the country indebted for the prompt emigration to Kansas, which eventually decided, not only the question of freedom in the Territories, but the question of freedom in the nation. Mr. Thayer at once drafted a petition for the incorporation of the Massachusetts Emigrant Aid Company. At the hearing before the Judiciary Committee of the Massachusetts Legislature he said:

This is a plan to prevent the forming of any more slave States. If you will give us the charter there shall never be another slave State admitted into the Union. In the halls of Congress we have been invariably beaten for more than thirty years, and it is now time to change the battle-ground from Congress to the prairies, where we shall invariably triumph.

Probably not a single person in the Judiciary Committee believed his plan in the least practical. The general feeling was that we were fifteen hundred miles from the battle-ground, and that every effort made would be overwhelmed by the unfriendly neighbors of the emigrants in Missouri before it could be renewed. But Mr. Thayer persevered, and the Legislature granted him, without opposition, the charter of the Massachusetts Emigrant Aid Company. In point of fact, no ultimate action was ever taken under this particular charter; but the same persons were subsequently incorporated under more convenient arrangements, and it is right to regard this company as that which took the initial steps in this matter. The reader must observe that the Kansas-Nebraska Bill had not yet passed. Although Kansas was not named in the charter, it was understood that

organized emigration to Kansas was the object for which the company was formed. The incorporators met at once, on the 26th of April, and named a committee of five to report a plan of organization and work. This committee consisted of Eli Thayer, Alexander H. Bullock and Edward E. Hale, of Worcester; and Richard Hildreth and Otis Clapp, of Boston. The three first were Worcester men. I had myself been interested in plans for organized emigration in the interests of freedom, since the annexation of Texas. Mr. Bullock, afterwards Governor, gave himself cordially to the plan. In practice the meetings of the committee of five were meetings of these three gentlemen, generally in Governor Bullock's office in Worcester. At his own charge Mr. Thayer hired Chapman Hall in Boston for frequent meetings, and on the 10th of May engaged Dr. Thomas H. Webb as the secretary of the company. The plan was very simple. It proposed that the agents of the company should deal with the various transportation companies and make favorable arrangements for taking groups of the emigrants in "parties." We foresaw that a body of men and women who were together would sustain each other, would maintain public opinion and would not be overawed; if necessary, they could defend each other by arms. On the other hand, such separate emigration of distinct families, as had filled the Northwest, would never be undertaken, even into a region as fine as Kansas, with the prospect of controversy and bloodshed. In the aroused condition of public feeling, Mr. Thayer believed, and the event proved, that a body of people going together would be comparatively strong and less exposed to insult. The company did not propose to intervene between the government and the settler; it only proposed to bring the settlers to the spot in groups, to establish mills and other necessities for a settlement; but were to leave to the settler such profit as he might make for himself, as the town in which he was, increased in population and his lands increased in value. In such a colony the associated settlers were glad enough to give to the Emigrant Aid Company a central position for the establishment of a saw-mill or other property for the common use. This simple organization, strange to say, was never devised before and had never been carried out before; it is a Worcester County invention, and the inventor is Eli Thayer.

What proved of as much value, perhaps, as any of the early steps in the enterprise, was the engagement by Mr. Thayer of Charles Robinson, also a Worcester County man, to go out and explore the country. Dr. Robinson was a physician in Fitchburg. He had long lived in California, where he had been an eager advocate of the rights of squatters. It may be said that what he did not know of a new community of settlers was not worth knowing. He was one of the few men in Massachusetts who had passed through Kansas. He was an earnest anti-slavery man, and

committed himself, body and soul, to the new enterprise from the beginning. With the assent of the other gentlemen of the committee Mr. Thayer engaged him at once to go to the Territory, that, by his personal information, he might assist the committee in taking the first steps. All this was done, be it observed, before the Kansas-Nebraska Bill became a law by passing Congress. Meanwhile, in public meetings and through the press, the directors of the new company were making use of all the information possible to interest the community in this movement.

On the 4th day of May a convention was called to meet in the Town Hall of Worcester, of a character much more practical than most of the conventions which met there. It was of men who were as much in earnest as Mr. Thayer had expressed himself to be in his speech in the month of March. That is to say, those persons were called who wished to unite for the purpose of *going to Kansas*. Mr. Thayer had, in the mean while, been occupying every moment of the day and the night in the interests of the new colony. On this morning he was too ill to leave the house,—worn out, as I suppose, by the constant exertions of two months. He sent me a note, which I still have and value highly, asking me to meet the convention in his place. I have never forgotten the occasion. In the great Town Hall, in which I had often spoken to audiences of twelve hundred people, there were perhaps one or two hundred men. They had the look of determination which belongs to the New Englander when he is well wound up and ready to start. People who were engaged at their daily business did not come to the meeting. As I recollect, there were very few persons there whom I had ever seen before; but I made some friends there who have been my friends to this day. A heavy storm was raging out-doors. There was no “buncombe” nor “popcock” in what we said; I was there to explain to them the practical method of going to Kansas, and, as well as I knew how, I did so. These men asked questions, and I gave them the best answers that I could. The drift of my speech may be inferred from the pamphlet written by myself, which, almost at the same time, the Executive Committee of the Emigrant Aid Society published. It lies before me as I write these words. It was printed by a Worcester printer, and went broadcast over New England and the West. It is the basis of a series of similar pamphlets, enlarged and changed as the occasion required, which were issued by the society in the next two years. The convention which met that day passed the following resolutions:

WHEREAS, The danger is imminent and pressing that slavery will succeed in its audacious and determined assaults upon freemen, and by a repeal of the Missouri Compromise subject the vast and fertile territories of Nebraska and Kansas to its blighting and desolating influences; therefore

*Resolved*, That it is the right and the duty of the people of the free States to neutralize the efforts of the slave power and its Northern confederates by the immediate occupancy of these territories with men

hostile to slavery, and in favor of basing the institutions of those territories upon the great principles embodied in the Declaration of Independence.

*Resolved*, That whatever may be the final action of Congress upon the Nebraska Bill (so called), now under consideration, that we ought not to leave the territories as they are. We ought, by acting in the territories, by our emigrants in the territories, by our moral influence in the territories, by our votes in the territories, to continue there the contest of freedom until its sure and final triumph is secured therein.

*Resolved*, That we regard a systematic and united effort to colonize in these territories free labor and free institutions as the best and most certain means of guarding them against the encroachments of slavery propagandism, and that we hail with pleasure all the movements now in progress having reference to such an object, whether in the West or in the East; whether they have their origin among the sons of the Pilgrims or those fugitives from the oppression of other lands, who are resolved to fight against slavery in all its forms in the country of their adoption.

*Resolved*, That inasmuch as many persons in all parts of Massachusetts have signified their desire to unite in an Emigrants' League, for the purpose of locating themselves and their families in the new territories, that it is expedient to form, as soon as practicable, an association of this kind, and that until such a time all persons desirous of joining in such plan of emigration be requested to send their names and addresses to a committee of this convention, that some estimate may be formed of the extent of the desire in favor of such emigration, under such auspices and as a preliminary step to the organization of the first New England Company of Nebraska and Kansas Emigrants.

*Resolved*, That the incorporation of an Emigrants' Aid Society, by the Legislature of Massachusetts, with a view to directing a systematic emigration to these territories, upon a gigantic scale, is a noble step in the right direction, and that we have the fullest confidence that that society will be a powerful instrument in advancing the cause of freedom and humanity.

*Resolved*, That such efforts as are now being made by this and kindred societies to introduce free labor and free institutions on the virgin soil of these territories must command the sympathy of freemen and Christians the world over—that it must arouse to the full the zeal of all who are embarked in it who would labor, not only as adventurers in a new land, but as the pilgrims who were the pioneers there of a great principle.

*Resolved*, That it would be as unjust as it would be impolitic in laboring for the perfection of a great and good object, to do anything not in accordance with the principles of true Christianity to attain our object, and that, so far as our influence can extend, the natural and guaranteed rights of the aboriginal inhabitants shall be sacredly regarded.

In the brief of my speech I find that I stated the plans of the company as I have explained them above. I said that we should arrange for parties of two or three hundred to go together, that we propose to build for each colony a central boarding-house, or boarding-houses, in which men could live while they were preparing their houses, and that we should make ourselves responsible for saw-mills, printing-presses and other necessary machinery. All these promises we kept. Mr. Thayer bade me say that there would be two thousand men from Massachusetts there in a short time. The prophecy of this was more than fulfilled. I met Dr. Robinson for the first time that day. He has been for many years my dear friend. But I always associate the thought of him with the wet india-rubber coat which he wore on that bleak May morning in that cold town-hall. Recollecting what followed from this meeting, it is pathetic to see how slight is the notice given of it by the Worcester papers of the day. The other speakers besides those named above were Mr. Mallory and Mr. Fay, but their speeches are not reported.

From this moment forward all of us who could speak were engaged in addressing public assemblies, and all of us who could write were writing for the press. I remember very well that I had the friendly co-operation of twelve leading newspapers in different parts of New England, the editors of which were glad to print anything which we could send them regarding Kansas. My father permitted me to print whatever I chose in the *Daily Advertiser*, which was the leading Whig newspaper in New England; and Mr. Horace Greeley printed whatever we sent him as editorial in the *New York Tribune*.

At the same time I was engaged, with my brother and my wife, in preparing the book called "Kansas and Nebraska," which is, I think, the first published book in the large literature of the history of that State. This book could hardly have been written conveniently anywhere excepting in Worcester. I had the co-operation of Samuel Foster Haven, the accomplished librarian of the Antiquarian Society, and I had the advantage of using all the stores of that invaluable collection. I doubt if I could anywhere else have written up the early history of the discovery of the Territory. Certainly we had great advantages in the public documents there, following along the history of its successive surveys. The reader should remember that up to this time there was not a white man legally settled in the Territory of Kansas, unless in the capacity of an Indian agent or under some other appointment from the General Government.

As to Worcester County, I do not venture to say in how many places Mr. Thayer addressed audiences in that eventful summer. I find on my own memorandum-book that I spoke at Bolton, from which, under the lead of our friend Mr. Wilder, an organized company went to the territory; in my own church; at Uxbridge; at a public meeting in Worcester on the 25th of August; at Northboro'; at Leominster; at New Bedford; at Shrewsbury; at Northboro' a second time; at Millbury and at Milford.

Of the interest taken in New England, the upshot was that several hundred clergymen became life members of the Emigrant Aid Society. I think that every settled clergyman in Worcester subscribed twenty dollars for this purpose. The first colony, of forty-three persons, left Boston on the 17th of July. It was under Dr. Robinson's lead and included many men from Worcester County; no women went with that colony. They established themselves at Lawrence, now the city of Lawrence, at the mouth of the

Wakarusa River. In the second colony, led by Mr. Branscombe, went their wives and children. So the business of filling Kansas with organized companies went on for two or three years. It was in the course of this summer that I learned from Mr. Thayer one of the secrets of his success. It is the same which Poor Richard gave to Paul Jones, in the words, "If you want anything done, do it yourself." But I think I am right in ascribing to Mr. Thayer the formula, which says that "personal presence moves the world."

After the very first, it proved that the charter of the Massachusetts Company did not satisfy men who were to subscribe money. My impression is that there was an individual liability danger, which no man could afford to meet. To meet this difficulty, Mr. Thayer, Mr. Amos Lawrence and Mr. J. M. S. Williams were made the trustees of all contributions, and as a board of trustees they conducted the affairs of the company, with the assistance of such committees of stockholders as they appointed, until the organization of the New England Emigrant Aid Company, which lasted for eleven or twelve years. The first meeting of the trustees was on July 24th, 1854. They assumed the responsibility for everything which had been done by Mr. Thayer and the other gentlemen interested in the matter, from the beginning. And the real work of the company dates, therefore, back to the beginning of the month of May.

Mr. Thayer had the loyal assistance and pecuniary backing of the two gentlemen who have been named. At one of the meetings in Chapman Hall, in Boston, Mr. Williams, who was a stranger to him, rose and said he was willing to give ten thousand dollars for the purposes of the company. Mr. Amos Lawrence made a subscription as large. At the request of Dr. Webb, Mr. John Carter Brown, of Providence, made a similar subscription, and was afterwards the president of the company for the whole period of its existence. Mr. Batchelder, a Worcester County man, subscribed ten thousand dollars. It should be remembered that none of these gentlemen ever received a cent back for the money thus paid, which became a successful sacrifice on the altar of freedom. There may have been other ways in which the problem of the freedom of Kansas could have been wrought out, but in fact it was wrought out by the plans conceived and executed by a citizen of the city of Worcester, with the loyal assistance of his neighbors, who trusted him and valued him.

*Stephen Salisbury*

## BIOGRAPHICAL.

## STEPHEN SALISBURY (1st).

Stephen Salisbury,<sup>1</sup> the first of the name in Worcester, was born in Boston, September 25, 1746, the son of Nicholas and Martha (Saunders) Salisbury. Upon attaining his majority, in 1767, he came to Worcester and established here a branch of the commercial house of Samuel & Stephen Salisbury, his partner being his elder brother. The firm imported hardware and other goods, English and West India, and their trade was among the largest at that time in Boston. Worcester proved a favorable situation for the centre of a large country trade. The town had scarcely a thousand inhabitants, but it was the centre of a large district from which people were attracted to it by the sessions of the courts and other business of the county offices, and it lay on the main highway of travel from Boston to the West. The Salisburys imported their own goods and the country traders found that they could buy almost as cheaply in Worcester as in Boston, and save the heavy cost of carriage over the rough roads of that time. Mr. Salisbury was an enterprising merchant, exact and just in his dealings, and his liberality and kindliness were such as to give him the personal affection of his customers to an unusual degree.

At the time of his arrival in Worcester political affairs were engaging much of the attention of the people, and the breach with the government of the mother country was slowly widening toward the complete separation which was to occur a few years later. In Worcester the excitement was higher than in most other places, for here were some of the most obstinate as well as most influential loyalists or Tories in the province, and also some of the most enterprising and resolute of the defenders of colonial rights. Mr. Salisbury early and decidedly committed himself to the patriotic cause. He accepted no office, but his name often appears in the town records as a member of a committee to prepare resolutions protesting against some act of tyrannical authority, or instructions to a Representative in the General Court, or to carry out some patriotic purpose.

Mr. Salisbury bought a large farm to the westward and northward of his place of business, which was at Lincoln Square, in the house now known as the Salisbury Mansion. To the east of the front door was the counting-room and salesroom. The household occupied the rest of the house and the heavy goods were stored in warehouses near by. Mr. Salisbury was of fine presence and of courteous manners. His housekeeping was elegant, but not ostentatious. Until he was well advanced in life his mother presided over his household, and not until after her death did he marry, January 31, 1797, Elizabeth

Tuckerman, daughter of Elward and Elizabeth Tuckerman, of Boston, by whom he had a son, Stephen, born in the next year; also Elizabeth Tuckerman, born in 1800, who died in 1803, and Edward Tuckerman, born in 1803, who died in 1809. Amid the exacting cares of business he found time to cultivate and improve his farm, and of the trees which he planted, among which, after the fashion of that day, were many Lombardy poplars, a few yet remain. Mr. Salisbury died May 11, 1829, in the eighty-fourth year of his age. When he died he was described by his friend and pastor, the Rev. Dr. Aaron Bancroft, as a "just man." His son said of his physical aspect: "His figure was slight and graceful, and his face was handsome, and he retained a complexion of youthful freshness until the end of his life."

## STEPHEN SALISBURY (2d).

Stephen Salisbury,<sup>2</sup> the second in Worcester, was born March 8, 1798, in the house built by his father in 1770 and now standing at Lincoln Square, a house whose comely dignity proves that the builders of that time had other merits besides mechanical skill and thoroughness.

His education, begun in the district school, was continued at Leicester Academy and Harvard College, where he was graduated in 1817. Among his classmates were George Bancroft, also of Worcester, Caleb Cushing, Samuel E. Sewall and Samuel J. May. After leaving college Mr. Salisbury studied law with the Hon. Samuel M. Burnside and was admitted to the bar. He did not make the law his profession or engage at all in its practice, nor probably did he ever intend to do so. But the study was a useful part of his education and equipment for a life of varied business employments and responsibilities. He spent two years in European travel, an advantage which was not enjoyed by so many Americans then as now. Mr. Salisbury was never a man of leisure. Besides his private affairs, which, in all their details, had his personal attention, he was much occupied with public matters and financial trusts. He was a selectman of the town in 1839, a member of the first Board of Aldermen under the city charter in 1848, a Representative in the General Court in 1838 and 1839, State Senator in 1846 and 1847, a Presidential elector in 1860 and in 1872, a director of the Free Public Library when the board was first organized and president of the board from 1863 to 1865, and again from 1868 to 1872. He was an overseer of Harvard College from 1871 to 1883, a trustee of the Peabody Museum of Archaeology and treasurer of its funds for fifteen years from its foundation. He was a member of the American Antiquarian Society from 1840, a member of the council from 1843, vice-president in 1853 and president from 1854 until his death.

He was a director of the Worcester Bank for fifty-

<sup>1</sup> By J. E. G.<sup>2</sup> By J. E. G.

two years, having been first chosen in 1832, and its president for thirty-nine years, from 1845. He was president of the Worcester County Institution for Savings from 1845 to 1871, when he resigned that office. He was a director of the Worcester and Nashua Railroad Company from its organization, in 1845, and its president in 1850 and 1851. He was a director also of the Boston, Barre and Gardner Railroad Company. He was the first president of the Worcester County Free Institute of Industrial Science, now the Worcester Polytechnic Institute, holding that office until his death. He was also for nine years a trustee of the State Lunatic Hospital at Worcester, was a trustee of Leicester Academy, president of the Worcester Horticultural Society and a member of the Massachusetts Historical Society.

Mr. Salisbury, in accepting these various trusts, recognized the duties they brought with them, and was exact even to punctiliousness in their discharge. Though always occupied, he was never hurried, and the time fixed for the completion of any official business by him always found the work done and his report prepared. He expected equal exactness in his associates, and did not shrink from rebuking in them any neglect of duty. It is said that when he was president of the library directors he made a point of advising any director who had been absent from two successive meetings that it was his duty to resign his office unless he could be sure of more constant attendance in the future.

In his long life Mr. Salisbury saw the little inland village of his boyhood, whose industries and interests were those of the centre of a flourishing agricultural district, grow to a city of seventy thousand people, the home of varied manufactures, some of which had their origin here, others had been developed by the ingenuity of Worcester inventors to an excellence not attained elsewhere, and several, in the amount of capital employed, the skill displayed in their processes and the extent of their production, had few rivals in the world. The railroad system also had its beginning and its extraordinary growth, changing all the conditions of business, bringing here, as to other New England towns, cheap food and materials of manufacture, making the people no longer dependent for the staples of subsistence upon the farms of the immediate neighborhood, making it possible to collect here the materials of an unusually varied industry, and to transport its products at a cheap rate to the remotest parts of our own and to other countries. It is remarkable that Worcester, with but scanty natural water-power, with no near supply of ores or coal or other essentials of manufacture, and no cheap water carriage, should not only have kept pace with other towns of New England having one or more of these advantages, but have outstripped most of them in the development of its industries and its growth in wealth and population.

Such results are not due to a mere caprice of des-

tiny, which, without visible cause, makes one village grow into a city and lets another, equally open to the favors of fortune, remain stagnant. The causes of prosperity and increase cannot always be traced with exactness and their relative efficiency assigned to each. They are many and diverse, and their mutual relations are intricate. Among the causes operative here was probably the political and social distinction which the town early acquired from the eminent men who, from colonial times onward, made their homes here, exerting a wide influence by their characters and their achievements in their professions, in politics and in statesmanship. Such men, by giving their town an honored name, made their fellow-townsmen proud of it and the more willing to establish here the work-shops and factories which their ingenuity and skill had created. Another factor of prime importance in the growth of the town, doubtless, was that Worcester was fortunate in having, at the beginning of the era of manufacture, besides ingenious inventors and skillful mechanics, wise directors or captains of industry,—men of orderly and provident minds, who recognized the value not only of capital inventions, but of minor improvements of machinery or process, the necessity of systematic and organized operations and scrupulous care of financial credit. These pioneers of manufacture trained their assistants and successors in correct habits of business, and gave a tone to the productive industries of Worcester which has enabled them to set at naught the natural disadvantages of their position as compared with that of their most successful rivals.

But, besides these and other favoring conditions, which cannot be detailed here, was the influence of the capitalists of the town, of whom Mr. Salisbury was the chief in extent of means and weight of character. He would scarcely be described as enterprising, still less as adventurous, but he was equally far from stubborn and obstructive conservatism. His imagination was not easily kindled by the enthusiasm of a sanguine projector or his reason convinced by a specious calculation of seductive profits. His coolness of temper, rigorous inquiry into details and sobriety of judgment as to results were sometimes exasperating to men of sanguine temperament, hasty conclusions and enthusiastic advocacy. But there is no doubt that this wisely conservative spirit of one having so great financial influence was immensely advantageous to the town in keeping its business sound, safe and healthy, and saving it from the shocks to credit and the losses of capital which would have followed the establishment of superficially promising, but insecurely founded enterprises. On the other hand, Mr. Salisbury was not timid or unduly tenacious of profit for himself or for those whose interests were in his charge. Both his fortune and his character made it his opportunity and his duty to have a large share in directing and assisting

*Stephen Salisbury*

the development of his native town. He accepted the duty and discharged it, as he did others, with scrupulous fidelity.

Amid the new forces, the lately discovered resources of ingenuity and skill, and the quickened enterprise which were recasting the destiny of Worcester when his active business life began, his judgment was undisturbed. He insisted upon convincing proof of solidity as a condition of encouragement to any new undertaking; but, once satisfied of that, his support was prompt and steadfast. The soundness and healthy growth of Worcester enterprises, and the generally excellent credit of our business men, are among the proofs of his wisdom. Mr. Salisbury contributed materially by his counsels and financial support to the development of the railroads centering here, and throughout his life was a large stockholder and director of one or more of them. He built at Lincoln Square the factory long known as "Court Mills," for the manufacture of agricultural implements, and, when the land was needed for other purposes, he built for the Ames Plow Company, which had succeeded to the business of the earlier partnership, the large factory on Prescott Street. He built for Ichabod Washburn the first wire-mill on Grove Street, and enlarged and improved the works to adapt them to the expanding business, finally selling the site to the Washburn & Moen Manufacturing Company. He also built several large factories, variously occupied, on Union Street and near it. Besides these direct contributions to the material progress of the community, Worcester is largely indebted to his exactness, method and fidelity in business for the high standard of commercial integrity and honor which has generally prevailed here, especially in financial institutions.

Such were Mr. Salisbury's relations to the community on its business side. His interest was certainly not less, and his influence larger, and, doubtless, more lasting, in the advancement of learning and in the establishment and fostering of institutions devoted to education and culture. He was a scholar and the friend of scholars. His love of literature gave him one of the pleasures which he most valued, and he was a systematic and thoughtful reader of good books in his own and other languages. His official relations to Harvard College have been already mentioned, and from that institution he received the degree of Doctor of Laws in 1875. He was a liberal benefactor of the American Antiquarian Society and its president for many years, presiding at its meetings with a benign and dignified courtesy, taking a keen interest in the papers presented and the discussions to which they gave rise, contributing himself the results of careful research and sound judgment in a simple, clear and dignified style. It was his custom to entertain at dinner the members of the society when they met in Worcester, and the annual gathering at his table in unrestrained social intercourse of

so many men of kindred tastes was one of the great pleasures of the year to both host and guests.

The wide range of Mr. Salisbury's intellectual interests and sympathies is illustrated by his equal care for the Antiquarian Society, which preserves the history of the past, and the Worcester County Free Institute of Industrial Science, now the Worcester Polytechnic Institute, which gives practical training to the mechanics, engineers, chemists and architects of the future. Of this latter institution he was the president from its origin until his death, and the largest contributor to its endowment. He superintended its affairs faithfully and wisely. The eminence which this school has already attained among institutions of like character and purpose is due in large measure to his generous bounty and sagacious counsel.

Mr. Salisbury's advice and aid were sought for many enterprises of education or charity, but he never gave until his judgment was satisfied or to escape importunate solicitation. In his private life he was courteous, dignified, but simple in his manner and in his habits. He was constantly accessible, though the demands upon his time and strength were greater than most men could endure, and it never occurred to any man who knew him that they met otherwise than as equals.

Mr. Salisbury was of a devout and reverent spirit. A member and constant attendant upon the services of the church of the Second Parish (Unitarian), he was thought somewhat old-fashioned by his contemporaries of later years in his strict observance of Sunday. His open mind recognized and respected sincerity and the essentials of true religion in Christians of all sects, and he often attended with satisfaction and spiritual profit the services of churches other than his own. He was all his life a student of the Bible.

Mr. Salisbury married, November 7, 1833, Rebekah Scott, daughter of Aaron and Phila Dean, of Charlestown, New Hampshire, who died July 24, 1843, leaving one son, Stephen Salisbury, Jr. He married, June 26, 1850, Nancy Hoard, widow of Capt. George Lincoln, who died September 4, 1852. He married as his third wife, June 2, 1856, Mary Grosvenor, widow of the Hon. Edward D. Bangs, for many years secretary of the Commonwealth.

In his youth Mr. Salisbury was not apparently of vigorous constitution, but correct habits and an active life increased his strength, and during most of his life his health was uniformly good. While his physical strength declined in his last years, he had no mental infirmities, but his mind was as clear and as active as ever, seeming, indeed, to maintain a constant and healthy growth. His last illness, of several weeks' duration, was rather the effect of age and the gradual failure of his bodily powers than of any acute disease. Having met every duty as it came, and left no task unfinished, he faced death without anxiety or regret,

dying on the 24th of August, 1884, in the eighty-seventh year of his age.

STEPHEN SALISBURY (3d).

Stephen Salisbury<sup>1</sup> (3d) was born March 31, 1835, in one of the block of brick houses near the lower end of Main Street, in Worcester, opposite the courthouse. He was the only child of Stephen and Rebekah Scott Dean Salisbury. His education was begun at the private infant-school of Mrs. Levi Heywood on Main Street, where the insurance building now stands. At the age of six years he passed the winter of 1841 and 1842 with his parents at Savannah. In 1842 he attended the private school of Mrs. Jonathan Wood, at the corner of Main and School Streets, and for a short time in 1844 was a pupil at Miss Bradford's private school in Boston. He entered the public grammar-school on Thomas Street in 1845, and continued there, under the instruction of Warren Lazell, and afterwards of C. B. Metcalf, until, in 1848, he entered the Worcester High School, of which Mr. Nelson Wheeler was then master. He entered Harvard College in 1852, and was graduated in due course four years later.

Immediately after leaving college Mr. Salisbury went to Europe, and became a student at the Frederick William University in Berlin. In the spring of 1857 he attended lectures for some months at the Ecole de Droit in Paris, and during the summer and autumn traveled with his classmates Rice and Kinnicut in England, Scotland and Ireland, and later in the year extended his travels to Turkey, Asia Minor and Greece, making a month's horseback tour in the latter country with a guide and mule-tee, during which he became familiar with the life of the people, and visited many places of historic interest. He resumed his studies at Berlin the next winter, and in the spring revisited Paris, whence, in May, he set out with his father's family upon a tour of several months in Italy, England, Scotland, Ireland and Wales.

After this absence of more than two years, Mr. Salisbury returned to Worcester in December, 1858, studied book-keeping for a time, and then entered the office of Dewey & Williams as a law student. A year later he entered the Harvard Law School, and after two years' study received the degree of LL.B., and was admitted to the bar in Worcester in October, 1861. In the winter of that year he visited his classmate David Casares in Yucatan, studying during his stay of six months many of the Maya Indian ruins and monuments. It may be added here, though out of the order of time, that Mr. Salisbury again visited Yucatan in 1885, extending his journey to other parts of Mexico and to Cuba. He re-examined some of the ancient buildings which he had formerly seen, and studied the character of the descendants of their builders. In this journey he observed with satisfac-

tion the progress of the country since his former visit, and gained confidence in the great future of the Mexican Republic, of which the many lines of railway already constructed, and the pacific, wise and resolute administration of the government by its enlightened president, Porfirio Diaz, are the most important factors now visible. Mr. Salisbury revisited Europe in 1888, and traveled in France, Belgium, Holland and Spain. He saw Spain under conditions peculiarly favorable for becoming familiar with the domestic life of the people, as he was accompanied by a gentleman from Yucatan, with whom he visited relatives of the latter still living in the mother country. Most of the chief cities of Spain were visited in this journey, which extended also into Portugal.

In 1863 Mr. Salisbury was elected to the Common Council of Worcester, and was re-elected two years later. In 1866 he was president of the board. He became a director of the Worcester National Bank in 1865, and was made its president in 1884, on the death of his father. He was a member of the Board of Investment of the Worcester County Institution for Savings in 1877, and has been its president since 1882, when, upon the death of the Hon. Alexander H. Bullock, Mr. Salisbury succeeded him in that office. He has been, since 1863, a director of the State Mutual Life Assurance Company; was a director of the Worcester and the Nashua and of the Boston, Barre and Gardner railroads at the time of their absorption by the Boston and Maine and the Fitchburg railroad companies respectively, and has been officially connected with other financial and business corporations. He was chosen a commissioner of the sinking funds of the city of Worcester in 1889. He was president of the Worcester County Horticultural Society in 1882.

Mr. Salisbury has been one of the builders of Worcester. Besides the Salisbury and Dean buildings, for business and residence, on Lincoln Square, an addition to the City Hospital and the laboratory of the Polytechnic Institute have been erected at his expense. He has given to the city, as a park or pleasure-ground, the tract, of about eighteen acres, bordering on Salisbury Pond, known as Institute Park, and has contributed in other ways to the prosperity and well-being of the city and the support of its institutions for charity, education and research. He has been a trustee of the City Hospital since its incorporation, and secretary of the board since 1872; and was for ten years secretary of the Memorial Hospital, of which he still continues a trustee; and he was for ten years treasurer of the Music Hall Association, of which he still is a director.

Mr. Salisbury was elected a member of the American Antiquarian Society in 1863, a member of the council in 1874, a vice-president in 1884 and became its president in 1887. He has contributed to its transactions several papers on the early inhabitants of Yucatan and their arts, as illustrated by recent discov-

<sup>1</sup> By J. E. G.

*Stephen Salisbury*

eries there, and has translated for the society, from the German, several valuable papers by Dr. Valentini, on these and kindred subjects. He also read, at the April meeting of the society, in 1888, a paper on "Early Books and Libraries."

He is also a member of the *Socièdad Mexicana de Geografia y Estadística*, of the *Conservatorio Yucateco*, of the Massachusetts Historical Society, and of the American Geographical Society. He was elected a trustee of the Worcester Polytechnic Institute in 1884, and of the Peabody Museum of Archæology in 1887.

#### SAMUEL SWETT GREEN.

Mr. Green was born in Worcester, February 20, 1837. He is a son of the late James Green and a nephew of Dr. John Green, the principal founder of the Free Public Library.

Through his father, Mr. Green is descended from the ancestor of an old Worcester County family, which traces its origin in America to Thomas Green, of Malden, Mass., who came to this country from England in about the year 1635 or 1636, and having lived elsewhere (perhaps in Ipswich, Mass.) for fourteen years or thereabouts, settled in Malden.

His son, also named Thomas, married Rebecca Hills, of Malden, a daughter of Rose Dunster (who was a sister of Henry Dunster, the first president of Harvard College).

Their son, Captain Samuel Green, became one of the chief founders of the town of Leicester, in this county, to which place he removed in about the year 1717. His son, Thomas Green, who went from Malden to Leicester when a boy, became one of its most distinguished residents. He was an eminent physician, a successful man of business and at the same time the founder of a Baptist Church in the portion of Leicester called Greenville and its acceptable pastor for a long series of years.

Thomas Green's son, John Green, came to Worcester in about the year 1757, at the age of twenty-one years, and began successfully to practice medicine here, having studied his profession under the supervision of his father, in Leicester. He became the ancestor of a numerous family, several representatives of which still live in Worcester. He married for a second wife Mary Ruggles, a daughter of Judge, or, as he is commonly called, General Ruggles, of Hardwick, a distinguished resident of Worcester County. Their son, John Green, of Worcester, was also an eminent physician. He married Nancy Barber, a descendant of one of the Scotchmen who came to America and settled in Worcester after their families had lived for a time in Ireland.

He was the grandfather of the subject of this memoir and the father of the late Dr. John Green, who was the most skillful surgeon and practitioner of medicine that has ever lived in this place, and will always be remembered as the principal founder of the Free Public Library.

It may be added here that the line of distinguished doctors who have borne the name of John Green has been continued in the present generation by an older brother of the subject of this memoir, John Green, M.D., a very eminent ophthalmic surgeon, whose home is in St. Louis, Mo. The only other living brother or sister of Samuel S. Green is James Green, Esq., a lawyer in Worcester.

Mr. Green's mother is Elizabeth Swett, daughter of Samuel Swett, of Boston and Dedham. Through her mother, who was a daughter of Dr. John Sprague, of Boston, she and the subject of this sketch are descended from an even earlier resident of the Massachusetts Bay Colony than Thomas Green, namely, Ralph Sprague, who came to Charlestown, in 1629, from Upway, Devonshire, England.

Through General Ruggles Mr. Green is also descended from Rev. John Woodbridge, one of the earliest settlers of Newbury and from his wife's father, Thomas Dudley, the second Governor of the colony of Massachusetts Bay. Rev. John Woodbridge was the brother of Rev. Dr. Benjamin Woodbridge, whose name stands first on the list of graduates of Harvard College.

The first school attended by Samuel S. Green was that of Mrs. Levi Heywood. Her school was discontinued, however, before long, and he was sent for several years to another infant school, which was kept by Mrs. Sarah B. Wood, now of Chicago, the widow of Jonathan Wood. From that private school he passed, upon examination, into the public grammar school on Thomas Street, which, during his studies there, was under the charge of Mr. Caleb B. Metcalf. Going next to the High School, he graduated from that institution in 1854, and immediately entered Harvard College. Among his classmates there, were two other graduates of the Worcester High School, namely, Eugene Frederick Bliss, who is now a resident of Cincinnati, Ohio, and the late Lieutenant Thomas Jefferson Spurr, who was mortally wounded at the battle of Antietam. Mr. Green graduated from Harvard College in 1858. In the early part of the summer of 1859 he sailed from Boston for Smyrna as a passenger in the barque "Race Horse," and before returning home, in the same vessel, visited Constantinople. Remaining two years in Worcester on account of ill-health, he resumed his studies at Harvard University in the autumn of 1861, and graduated from the Divinity School connected with that institution in 1864.

During the Civil War, and while in the Divinity School, Mr. Green was drafted for service in the army, but was debarred from entering it by delicate health. He took the degree of Master of Arts at Harvard University in 1870, and June 28, 1877, was chosen an honorary member of the Phi Beta Kappa Society by the chapter of the order connected with the same university.

In 1864 Mr. Green became book-keeper in the Me-

chanics' National Bank of this city, and in the course of a few months teller in the Worcester National Bank. The latter position he held for several years. Mr. Green became a director of the Free Public Library January 1, 1867, and four years later, January 15, 1871, librarian of the same institution.

The latter is the position which he now holds. A history of the Free Public Library, including an account of the work done under Mr. Green's administration of its affairs, is given in another portion of this volume, in the chapter on Public Libraries.

The library has grown rapidly in size and usefulness under his care. It contained, December 1, 1888, 73,669 volumes. The use of its books in the year ending with that date was 206,290. A feature in that use is the remarkably large proportion of books that is employed for study and purposes of reference.

Mr. Green is regarded as an authority among librarians in respect to matters relating to the use of libraries as popular educational institutions, and in respect to the establishment of close relations between libraries and schools.

He was for several years chairman of the Finance Committee of the American Library Association, and has lately been a member of the council of that organization. At its last regular meeting, held in September, 1887, he was elected its first vice-president. He has also been for several years chairman of a committee of the association, the duty of which is to try to secure from Congress legislation satisfactory to libraries for the distribution of public documents.

Mr. Green was a delegate of the American Library Association to the International Congress of Librarians held in London in October, 1877, was a member of the council of that body, and took an active part in the discussions carried on in its meetings. Before the close of the Congress the Library Association of the United Kingdom was formed. Mr. Green was chosen an honorary member of that association in July, 1878.

He has been for many years a member of the committee appointed by the overseers of Harvard University to make an annual examination of the library of the university, and began, in 1887, to deliver annual courses of lectures as lecturer on public libraries as popular educational institutions to the students of the school of Library Economy connected with Columbia College, New York City.

Mr. Green was chosen a Fellow of the Royal Historical Society of Great Britain May 8, 1879, and on April 28, 1880, a member of the American Antiquarian Society. Since October 22, 1883, he has been a member of the council of the latter organization. He was also elected a member of the American Historical Association soon after its formation. October 12, 1882, Mr. Green was chosen a member of the Board of Trustees of Leicester Academy, to fill the vacancy caused by the resignation of Rev. Edward H. Hall, upon his removal from Worcester to Cambridge.

In 1886 he assisted in the formation of the Worcester High School Association, and was chosen its first president and re-elected to the same position in 1887.

In the summer of 1886 he was chosen president of the Worcester Indian Association, and held the office for two years. Mr. Green is a vice-president of the Worcester Art Society. He was also at two different times and for several years treasurer of the Worcester Natural History Society.

Mr. Green has written constantly for the *Library Journal* since its establishment, and has made many contributions to the proceedings of the American Antiquarian Society. He has also written papers for the *American Journal of Social Science*, the *Sunday Review* of London and other periodicals.

Two books by him were published by the late Frederick Leypoldt, of New York, namely, "Library Aids" and "Libraries and Schools." Both were printed in 1883. The former work, in a less complete form, had been previously issued by the United States Bureau of Education as a circular of information.

At the request of the secretary of the Board of Education of Massachusetts, Mr. Green wrote an appendix to his forty-eighth annual report on "Public Libraries and Schools." The essay was afterwards printed as a separate pamphlet.

Mr. Green has made many addresses and read a number of papers on library and other subjects. Among them are "Personal Relations between Librarians and Readers," a paper which was presented to the meeting of librarians who came together in Philadelphia in October, 1876, and formed the American Library Association (of this paper two editions have been printed and exhausted); "Sensational Fiction in Public Libraries," a paper read July 1, 1879, at one of the sessions of the meetings of the American Library Association held in Boston in that year (this paper was also printed in pamphlet form and widely distributed); "The Relation of the Public Library to the Public Schools," a paper read before the American Social Science Association at Saratoga in September, 1880 (this address was printed in the form of a pamphlet, and has been widely read and very influential in awakening an interest in work similar to that described in it); papers and an address on subjects similar to the one last mentioned, read or delivered at meetings of the American Library Association in Cincinnati and Buffalo and at Round Island, one of the 'Thousand Isles' in the St. Lawrence River.

The more elaborate historical papers which have been prepared by Mr. Green are: "Gleanings from the Sources of the History of the Second Parish, Worcester, Massachusetts," read at a meeting of the American Antiquarian Society held in Boston April 25, 1883, and "The Use of the Voluntary System in the Maintenance of Ministers in the Colonies of Plymouth

and Massachusetts Bay during the Earlier Years of their Existence," an essay which formed the historical portion of the report of the council of the American Antiquarian Society, which Mr. Green presented to that society at its meeting in Boston April 28, 1886.

Both of these papers have been printed in a form separate from the proceedings of the society for which they were written.

Mr. Green is chairman of the committee which has had charge of the assignment of portions of the present history of the county of Worcester in so far as the history of the town and city of Worcester is concerned.

The committee has also read the papers prepared at its request for the history, and made such suggestions to the writers, before and after their preparation, as it seemed to it desirable to make.

Mr. Green has himself contributed to the history the chapter on the Public Libraries of Worcester.

#### CHARLES A. CHASE.

Charles A. Chase is one of our fellow-citizens who is native and "to the manner born." He was born in the house on Salisbury Street—afterwards converted into a double one, and now to give way to the new Armory Building—September 9, 1833.

Anthony Chase, his father, though born in Paxton, June 16, 1791, came to Worcester at a very early age, his father buying a farm on the heights of Fowler Street. He was educated at Leicester Academy, and later married Lydia Earle, daughter of Pliny Earle, of Leicester.<sup>1</sup> In the year 1816 he was engaged in business with his future brother-in-law, John Milton Earle, at first in carrying on a general store in Worcester, and later in publishing the *Massachusetts Spy*. Mr. Chase was the first local agent here of the Blackstone Canal; was county treasurer from 1831 to 1865, secretary of the Worcester Mutual Fire Insurance Company from 1831 to 1852, and its president from that time to his death, August 4, 1879. He was the first secretary of the Worcester Lyceum; was one of the originators of the Worcester County Mechanics' Association, and held several offices of public trust.<sup>2</sup>

The subject of our sketch attended infant school in the little seven-by-nine school-house which has stood until recently at the north end of Summer Street. He was one of the class that graduated from the Thomas Street Grammar School, in 1845, into the new "Classical and English High School." He remained in the High School for five years, taking, in addition to the classical course, an extended course of mathematics, under that most competent instructor, William

E. Starr. During his connection with the High School he printed a juvenile paper, *The Humble Bee*, which is noticed more fully in the chapter of this history relating to newspapers. He entered Harvard College in 1851, and was graduated in 1855, receiving the degree of A.M. in 1858. By invitation of his friend, Mr. Charles Hale, editor of the *Boston Daily Advertiser*, he joined the staff of that paper in 1855, and filled the position of reporting the various departments and of office editor for seven years. In 1862 he made a five months' tour of Europe, seeking rest, and on his return was led, from family considerations, to take up again his residence in Worcester.

In the autumn of 1864 he was elected county treasurer, succeeding his father, and held the office for eleven years. In 1875, Mr. Harvey B. Wilder—who had been appointed by the county commissioners register of deeds at his father's death—gave notice that he should not be a candidate at the polls for the remaining year of his father's term. The Republican County Convention placed a candidate in the field, but a large number of influential gentlemen of both parties, having at heart the interests of this important office, invited Mr. Chase to stand as an independent candidate. The Democratic County Convention also tendered him the nomination, and he was elected, some towns in the county giving him a nearly unanimous vote. He served as register for the centennial year of 1876. The managers and dictators of the Republican party spared no pains to defeat his re-election. The party lines are always drawn more closely in the year of an election of President, and, having induced Mr. Wilder to withdraw his opposition and to stand as a candidate, the Republicans were enabled to defeat Mr. Chase at the polls, and Mr. Wilder returned to his desk in the office in January, 1877. Mr. Chase was soon afterwards elected secretary of the Worcester Board of Trade.

In 1879 Mr. Chase, under contract with Messrs. C. F. Jewett & Co., of Boston, wrote a history of Worcester for the County History published by that firm. This work was required to be done in a limited time, but he was able to incorporate into it considerable matter, the result of original research, which had never before appeared in print. In the same year he served as treasurer and manager of the Worcester Telephone Company. The Western Union Telegraph Company were among the stockholders. The instruments used were the Edison transmitter and the Gray receiver, and the service which they gave has not been improved upon to the present time. After spirited competition with the American Bell Telephone Company, which had established a rival exchange, the Telegraph Company and the Bell Telephone Company entered into a kind of partnership, covering the whole country, and the two Worcester exchanges were merged into one, the Worcester gentlemen selling out their stock.

<sup>1</sup> The biography of Pliny Earle will be found in our "History of Leicester."

<sup>2</sup> For an account of the life of Anthony Chase see Comley's "History of Massachusetts," Boston, Comley Brothers, 1879.

On November 10, 1879, Mr. Chase was elected treasurer of the Worcester County Institution for Savings, (succeeding Mr. Charles A. Hamilton, who had died in office,) and still holds that trust. He was secretary of the Worcester Lyceum and Library Association from 1863 to 1866; vice-president, 1867-68, and on the Lecture Committee from 1866 to 1880; a director of the Public Library from 1868 to 1874; director of the Citizens' National Bank from 1880 to 1889, and of the Worcester National Bank from January, 1888; director of the Merchants' and Farmers' Fire Insurance Company from 1883; is vice-president of the Worcester Art Society, a trustee of the Washburn Memorial Hospital, and a councilor of the American Antiquarian Society.

#### NATHANIEL PAINE.

Nathaniel Paine is a public man in the sense that he has been identified with many of the city of Worcester's most important and most cherished institutions. He belongs to an old Worcester family, and his Christian name, Nathaniel, appears in each one of its generations since it was founded in America. Stephen Paine emigrated to New England in 1638, from the township of Great Ellingham, Norfolk County, England, and settled in Hingham, Plymouth County, Massachusetts. He brought with him his wife and three sons, and, as the records show, four servants, though some of them may have been helpers in his business, which was that of a miller. It appears, at least, that he was a man of substance, as well as energy and character. In 1641-42 he removed, with four of his townsmen, to Seekonk, and the new settlement, which had the advantage of the ministrations of Rev. Samuel Newman, came presently to be called Rehoboth. The name of Stephen Paine often appears on the records of the new town as holding offices of honor and trust. He died at Rehoboth in 1679.

One of his three sons disappears from history. The eldest son was called Stephen. His second son, Nathaniel, born in England, came to New England with his father and became a man of some considerable prominence in Rehoboth, and was a deputy from there to Plymouth Court in 1676-77. The only son of Nathaniel named for his father was the progenitor of the Worcester Paines, and early in life became a resident of Bristol, R. I. He was a judge of Probate, and also one of the Council of Massachusetts Bay from 1708 till his death, in 1723. One of his sons—the third Nathaniel—was a representative in the Colonial Legislature and a judge of the Court of Common Pleas. And so we come in the fifth generation to Timothy, born in Bristol, R. I., in 1730, who removed to Worcester with his mother in 1739-40, and married, in 1749, Sarah, daughter of Hon. John Chandler and Hannah Gardiner, his wife, by which marriage the Paines and Chandlers became first connected.

Timothy had seven sons and three daughters, of whom five were married. Nathaniel, the sixth child, was the grandfather of the present Nathaniel Paine.

He was a representative to the General Court in 1798, was judge of Probate for Worcester County thirty-five years, resigning in 1836 on account of ill health, and was one of the founders and a councilor of the American Antiquarian Society.

He married the daughter of Gardiner Chandler, whose residence was on Main Street, opposite Park Street. Judge Paine's house and office were on the corner of Main and Pleasant Streets, his garden and grounds extending up the north side of Pleasant Street nearly to Chestnut Street. Judge Paine died in Worcester in 1840. He had seven children. The second son, Gardiner, was in business. He was active in military matters, held the office of major by the appointment of Governor Lincoln, and was a charter member of the Worcester Guards. He was also a prominent member of the Horticultural Society, in which he took an active interest. He was the father of the present Nathaniel Paine, and died in January, 1854.

It may partly appear from this fragment of genealogy that the Paines have been prominent in the affairs of the day since their ancestor, Stephen, landed on Plymouth shores.

The present Nathaniel Paine is a worthy representative of the name. He was born in Worcester August 6, 1832, and was educated in the public schools of the town. At seventeen years of age he entered the Mechanics' Bank of Worcester, and ever since has devoted himself to financial affairs. His intelligence and solid trustworthiness brought him early into notice. In 1854 the growing city required additional banking facilities; the City Bank was organized under the State laws, and Mr. Paine, then only twenty-two years of age, was made assistant cashier. Three years later he became cashier, and has held that position ever since. To large business capacity he adds the courteous manners which spring naturally from a kind heart. Such honors as have come to him have been given ungrudgingly. He has not sought them—they have come mainly in the line of his scholarly tastes joined with his methodical training as a banker. His grandfather and his great-uncle were among the founders of the American Antiquarian Society, and Mr. Paine was early admitted to that ancient and dignified body as a matter of course. Since 1863 he has held the responsible position of treasurer and custodian of their various and considerable bequeathed funds. He is also a member of the Worcester Society of Antiquity, the New England Historic Genealogical Society and corresponding or honorary member of the Long Island, the Pennsylvania and the Georgia Historical Societies.

He was one of the founders of the Worcester Natural History Society, and for several years its president. For a long series of years he was a director of

*Wm Dickinson*

the Free Public Library, and most of the time was the secretary of the board and treasurer of the funds belonging to the library. He has served in the City Council two years, and was for several years a trustee of the Worcester County Horticultural Society. He is now president of the Worcester Art Society.

These titles may be quickly read, but they count for a vast amount of patient, unsalaried labor for the public welfare, extending over a long series of years.

Mr. Paine has a large and interesting library, but its distinguishing feature is not so much costly bindings and rare editions, although it is not without these expensive treasures. One of his favorite tasks is to patiently expand volumes by adding to them rare portraits, autographs and MS. bearing on their contents. In this way, "Irving's Life of Washington," originally in five volumes (the special edition of one hundred and ten copies), has grown to ten volumes, and contains rare and almost priceless matter. A "Biographical History of the Fine Arts," in two volumes, has been extended to nine, and the portraits of artists, originally one hundred, now number upwards of eight hundred.

His volume of "Autographs and Portraits of the Signers of the Declaration of Independence" is complete, with the exception of a few autographs.

The making of scrap-books Mr. Paine has cultivated as a fine art; nor is the element of humor lacking from his collection—the works of Cruikshank, John Leech, Du Maurier and Nast have not been forgotten.

Mr. Paine is the author of several monographs on matters of history and bibliography. Among them may be mentioned "Remarks on the Early Paper Currency of Massachusetts," "Historical and Chronological Notes on the Town of Worcester," and "Bibliography of Worcester History."

#### WILLIAM DICKINSON.

Worcester has been signally fortunate in having among her citizens many who, though not natives, have by their ability, enterprise and integrity added greatly to her prosperity and renown. By the phrase "who though not natives" is simply meant such as were not actually born within her borders. And it is much to her credit for discernment that she has perceived the good qualities of this class and for her shrewdness that she has availed herself of their efficient services and cordially enrolled them among her sons. Even in looking over the biographical sketches in the present volume the student of Worcester's history will find much that is striking in the direction here indicated. But while this is said, the fact is not to be forgotten that she has always had many of native birth who have done honor to her name, and contributed their full share in the building up of the fair name she now so pre-eminently enjoys.

Among those who were not natives in the sense indicated must be ranked Mr. Dickinson, whose name appears at the head of this sketch. He was born in Amherst, Mass., on the 6th of October, 1804, and died in September, 1887, having nearly completed his eighty-third year. He was a son of Samuel Fowler Dickinson, a lawyer of high standing in the Hampshire bar, and father of a large and reputable family, one or two of whom filled responsible public offices in the county.

Mr. Dickinson's education was good, though he was not a college graduate. From the common district school he entered Amherst Academy, where he received such training as fitted him at the age of fifteen to enter upon the business life in which he was so successful and acquired so fair a name that he was long regarded as a worthy model for the imitation of all who seek a high position in the business world. He always entertained a great respect for learning, and was liberal in his contributions for the support of educational institutions; was a member of the School Board for three years; gave the bell for the High School and the fountains that now adorn the plat in front of the building. He was a director of the Free Public Library and a member of the Worcester Society of Antiquity.

His first employment after completing his education was in a Boston dry-goods house. He was subsequently in the paper manufacture in Hardwick and Fitchburg.

It was in 1829, at the age of twenty-five, that Mr. Dickinson came to Worcester, and here he resided till the time of his decease, nearly sixty years. He at first applied himself in the service of others; was a clerk in two or three business establishments, and then in other similar, but to him rather uncongenial, employment, till 1836, when he was elected to the responsible and trustworthy office of cashier of the Central National Bank. This, of course, was a voucher for his honesty and capability as a financier. He held the office for fourteen years, and such a character did he acquire for promptness and integrity in pecuniary matters that he soon found himself in various offices where skill and trustworthiness were of the greatest importance, such as treasurer of the State Mutual Life Assurance Company and treasurer of the Merchants' and Farmers' Insurance Company, both of which offices he held for many years, not less than forty. He was likewise for a long time a director in the Quinsigamond Bank and in the Providence and Worcester Railroad.

In 1863 Mr. Dickinson, with one or two associates, began the manufacture of paper machinery, which was continued some eight years, and then he engaged in the felting business, in which his son, Mr. Samuel F. Dickinson, subsequently became connected with him.

Mr. Dickinson was not what would be called an active politician; certainly not an obtrusive zealot,

but from time to time he filled various local offices with credit to himself and benefit to the public. He was a Common Councilman and an alderman for several terms. So far as he was a partisan he ranked with the Republicans, having been of the old Whig school. By Governor Butler he was appointed a trustee of the State Lunatic Hospital, and for the general he entertained profound respect, almost adoration, induced probably by the efficient services rendered by that able commander during our Civil War.

In his religious views Mr. Dickinson was liberal, but identified with the Trinitarian Congregationalists. Though a regular attendant on the services of the Union Church, he was not what is technically called a "professor."

Mr. Dickinson became a man of large means, and his liberality kept pace with his accumulations. He was justly regarded as a most valuable citizen, a sympathetic neighbor and a fast friend. In social life he was esteemed for his intelligence, urbanity and far-reaching fellow-feeling. He was twice married. His first wife was Miss Eliza Hawley, of Andover. By her he had one son, who became a graduate of Brown University and afterwards a lawyer in New York. His second wife was Miss Mary Whittier, also of Andover. By her he had two sons and one daughter. It was the elder son, Samuel F., who became a partner in his father's business. George S., the younger son, was a graduate of Yale. The daughter, Helen W., married Thomas L. Shields, of Pittsburg, Pa.

#### GEORGE CHANDLER.

Dr. Chandler has been long and favorably known from his connection with New England Hospitals for the Insane. He was born in Pomfret, Ct., on the 28th of April, 1806, and hence has already attained an age that few of us reach. He was a son of Major John Wilkes and Mary (Stedman) Chandler. His father was a farmer, and on the farm the son worked till the age of seventeen, attending the district school during the terms usual at that period. After his seventeenth year he was a student in the Academies of Dudley and Leicester, in this State, and that of Woodstock, in Connecticut. He entered Brown University, where he remained a part of two years, but graduated from Union College in 1828. He studied medicine with his brother-in-law, Dr. Hiram Holt, of Pomfret; attended a course of medical lectures at Harvard College, and another at Yale, receiving at the latter the degree of Doctor of Medicine. This was in 1831, in November of which year he settled in Worcester in the practice of his profession.

In March, 1833, Dr. Chandler went into the State Lunatic Hospital as an assistant to Dr. Samuel B. Woodward, then in charge of the institution. Here he remained till May, 1842, when he retired, his first

marriage taking place very soon after. In October of the year just named he took charge of the New Hampshire Asylum for the Insane, at Concord, an institution built after a plan submitted by him. The management of this asylum was begun with small means, though much credit by local merchants was offered. It had the capacity of a hundred and twenty patients, and the first admission was in October. After a little more than three years it became nearly full and was out of debt, on a charge of but two dollars and twenty-five cents per week for the care and board of each inmate.

To the surprise and much against the wishes of the Board of Trustees, but in compliance with the earnest solicitation of friends, he resigned his charge there—a charge made pleasant to himself by his successful performance of the duties devolving on him, and by his successful efforts otherwise in behalf of the institution.

After an interval of a few months he succeeded Dr. Woodward as superintendent of the State Lunatic Hospital at Worcester, which position he resigned in July, 1856, after ten years' service. During his residence of twenty-five years in the two institutions (the one at Concord and that at Worcester) he had the charge, wholly or in part, of about six thousand insane persons. That at Worcester was always full while he was assistant, and at the time he was superintendent it was especially so, the number being at one time five hundred and sixty-eight.

Since leaving the care of lunatics he has made his home in Worcester. In 1862 he was at Fortress Monroe, as medical chief of the ship "St. Mark's," detailed to bring home the wounded in the Civil War, and in August took on board one hundred and thirty-four of McClellan's wounded soldiers, to be landed in Chester, Pa.

Dr. Chandler has been called to fill various offices of a public and semi-public character, and has always acquitted himself with ability and discretion, meriting and receiving the approbation of his fellow-citizens. He has been an inspector of the State Almshouse at Monson, a member of the Legislature, a justice of the peace and an alderman of the city. He has likewise been a member of the Massachusetts Medical Society and an honorary member of the New Hampshire and Connecticut Medical Societies. It may be mentioned, too, that he was commissioned as surgeon of a Light Infantry Regiment.

Dr. Chandler was united in marriage, for the first time, on the 4th of May, 1842, with Josephine Rose, daughter of Joseph W. and Harriet (Paine) Rose, and granddaughter of the late Dr. William Paine, of Worcester. The children by this marriage were Mrs. A. George Bullock and Mrs. Waldo Lincoln, of Worcester. His second wife was Mary E. Douglas, widow of Charles A. Wheeler, whom he married April 8, 1874, but by whom he had no children.

In 1867 Dr. Chandler, with two daughters, visited

*William Workman*

Europe, where they remained two years ; and in 1874 he went again, with his second wife, remaining, as before, some two years.

It is quite unnecessary to enlarge upon the merits of Dr. Chandler as a citizen, as he is too well known to need anything of that kind. The respect that has been universally awarded him, these many years, and the success that has attended him in the various important and often trying positions he has occupied, abundantly testify to his high character and worth.

#### WILLIAM WORKMAN, M.D.

Dr. William Workman was of Scotch-English descent. The ancient family seal has for its motto: "Non pas l'ouvrage, mais l'ouvrier," which may indicate a French origin of the family. But it is known that the Workmans had lived for several generations in England. One of them was Rev. John Workman, a clergyman of the Church of England at St. Stephen's Church, Gloucester, a man of "great piety, wisdom and moderation." He was prosecuted by Archbishop Laud, about 1634, for preaching against the use of pictures in churches, was suspended from the ministry, imprisoned and excommunicated, and died in consequence of the persecution which he suffered. A little later we find the name of William Workman, an officer in the English army, under Oliver Cromwell, who distinguished himself in the campaign in Ireland in 1649, especially at the siege of Drogheda. He was rewarded for his services by a grant of large estates of confiscated lands in County Armagh, in the North of Ireland. In 1689 his son William was among the Protestants who were compelled to flee from their homes to the fortress of Londonderry, where they were shut in by the Irish Catholic army, and suffered the horrors of that remarkable siege. The musket which he used during this siege is in the possession of a branch of the family in the old country. In the next generation a part of the Workman family settled near the market-town of Coleraine, on the river Bann, in Ulster. Two generations later a number of families from Coleraine came to the United States, and founded a town of the same name in Franklin County, Massachusetts. Among these was the widow of William Workman, a grandson of William Workman of Londonderry, who crossed the Atlantic in 1735, bringing her son John, then a boy of six years. This widow was a woman of great force of character, a stanch Scotch Presbyterian, who lived to a great age. Her son, John Workman, lived in Deerfield, Mass., during his minority. He married Phebe Stewart, of Concord, Mass., and, about 1750, purchased a tract of uncleared land, in what is now the southeastern part of Coleraine, and erected on it a farm-house, in which he lived more than sixty years. Two apple-trees, which are said to have been planted by him, are still standing. He died in 1813,

at the age of eighty-four. His second son, Daniel Stewart, married Dorothy Perry, of Westminster, and settled on his father's farm. He was a well-to-do farmer, who lived independently on his ancestral acres. He had twelve children, of whom eight lived to adult years. His farm, which has been in the possession of the family for four generations, is of excellent soil, and is situated in a beautiful hilly region. He died in 1855, at the age of eighty-four years.

His son William was the oldest of his children, and, therefore, inherited the name by which so many of his ancestors had been called. He was born January 21, 1798. He remained at home until he was nineteen years of age, doing his part of the work on the farm, attending such schools as were within his reach, and reading eagerly the few books which he could get in that remote rural town. Besides the Bible and the New England Primer, which were in every family, he read, during his boyhood, "Robinson Crusoe," "The Story of Blue Beard," "Cinderella," "The Arabian Nights," "The Early Life of Napoleon Bonaparte," "Travels Among the Arabs in Central Africa," "Thaddeus of Warsaw," and parts of "Rollin's Ancient History." In due time he entered Hopkins Academy, in Old Hadley, then under the care of Rev. Daniel Huntington, and of Worthington Smith. Here he was prepared for college. But repeated attacks of illness caused a general failure of health, which at length compelled him to give up the college course.

He began the study of medicine in 1822, in the office of Dr. Seth Washburn, of Greenfield. In the fall of that year he attended lectures in the Medical Department of Harvard University, and continued his studies there and with Drs. Flint and Mather, of Northampton, till August, 1825, when he received the degree of M.D. from Harvard. He began practice immediately in Shrewsbury, where he remained ten years. He met from the first sharp competition, but he deserved success, and won it, not only by his skill, but by the excellence and strength of his character. In 1828 he married Sarah Paine, daughter of Hon. Vashni Hemenway, of Shrewsbury, whom he survived about four years. In 1835 he came to Worcester, where he lived more than fifty years. He retained for some time a large part of his business in Shrewsbury, in addition to the new business which he gained in Worcester. Dr. Workman was strongly attached to his profession, and devoted his whole energies to its exacting requirements. He was all his life an earnest and constant student, and kept well abreast of the rapid advances of medical science. He was for several years a contributor to *The Boston Medical and Surgical Journal*. His articles are characterized by careful and accurate description of cases, and show that he possessed a thorough knowledge of his profession. Of quick perception and sound judgment himself, he had a profound contempt for all shams and

pretences, and was recognized as an able, progressive and conscientious practitioner. He excelled as well in the department of surgery as in that of medicine. Some of his surgical operations, which are remembered by his grateful patients, were remarkably bold and skillful. He had a good share of patronage from the leading families of Worcester, and was frequently called in consultation, not only in the city, but to other places in the State.

He became a member of the Massachusetts Medical Society in 1831, was elected councilor in 1840, and held this position twenty-four years. He was chairman of the committee of arrangements at the annual meeting of the society held in Worcester in 1851, and delivered the annual address at the meeting in Fitchburg in 1852. He selected for his subject "The Ethics of the Medical Profession," and spoke with abundant illustration of the relations and duties of physicians to each other, to their patients, and to the community. It is a very elaborate address, full of wit, and shows a wide acquaintance with medical writers, as well as a broad view of the relations of the profession to society. It is an earnest plea for manly courtesy and unselfishness in all the dealings of physicians. Dr. Workman was also a member of the American Medical Association, and was frequently a delegate from the State Society at its earlier meetings. In 1831 he joined the Worcester District Medical Society, and for many years took a prominent part in its proceedings, serving on important committees, and occupying at one time or another all its offices, except that of librarian. He always retained his interest in the society, and two years before his death gave it his medical library. He was also a member of the Worcester Medical Improvement Society.

His horizon was by no means bounded by his profession. He interested himself in all that concerned the city of his adoption, and although he neither desired nor held public office, endeavored to do his whole duty as a citizen, and gave liberally of his time and means to objects of public importance. From 1840 to 1850 he served with Hon. A. D. Foster and Rev. Drs. Sweetser, Hill, and others on the "Board of Overseers of Schools for the Centre District," the latter part of the time as secretary of the board; and also for several years on the Public School Committee, after Worcester was made a city. He was president of the Lyceum Society, and read before it a number of papers on scientific subjects. He was trustee of the Worcester County Institution for savings from 1848 to 1873, and was director in the Peoples' Insurance Company of this city from 1860 till its dissolution after the Boston fire in 1872. In 1862 he was appointed by Governor Andrew trustee for five years of the Worcester Lunatic Hospital, and was reappointed by Governor Bullock in 1867. At the close of his second term he was again appointed, but declined further service. At the time of the seven days' battles, in 1862, Dr. S. H. Howe, in behalf of

the Sanitary Commission, telegraphed him to send volunteer surgeons to act with that organization in caring for the wounded. Although then sixty-four years of age, he at once offered his services, and went to Fortress Monroe as surgeon, in charge of a government transport. He was among the earliest members of the Worcester County Horticultural Society, was vice-president of the society from 1844 to 1853, and again in 1857, and was a member of its Board of Trustees as long as he could be induced to serve. The trustees say of him in their annual report: "His judgment was always sound and conscientious, he was a rare adviser, and was seldom thrown off his balance. This society has lost by his death a life-long and consistent friend. Since his death his children have presented the society an admirable portrait of him."

Dr. Workman continued in the practice of medicine, devoting to it his best powers of body and mind, until he was past the age of seventy, when he began to seek relief from its more arduous duties. But he continued for some years longer to give professional advice, and to act in consultation. In the comparative leisure in which he found himself, he carried out a plan, which he had long cherished, to visit Europe. He sailed from New York for Havre in the spring of 1870 with his wife and two daughters, and was absent a little more than six months, going south as far as Naples, and east as far as Vienna. He enjoyed this trip exceedingly, and was accustomed in later years to say that it had added ten years to his life.

In his religious views Dr. Workman was an Orthodox Congregationalist. He became a communicant in the Union Church, under the pastoral care of Rev. Dr. Smalley, in 1840. Although he was not inclined to make himself conspicuous in the meetings of the church, he was put forward to do a great deal of work on committees by both the church and the parish. He is spoken of, by those who were conversant with him, as a steady friend of the church and its ministers, an attentive and appreciative listener to preaching, and an upright and consistent Christian.

After his retirement from active life he continued his habits of study, devoting much of his time to reading outside of his profession. He kept himself well informed on the live issues of the day, as well as those of history, the study of which was his especial delight. His declining years were passed in the city which had been so long his home, in the companionship of his old friends and neighbors, in the house which he had built almost forty years before. He had a cheerful and beautiful old age, and died October 17, 1885, in the eighty-eighth year of his age. His surviving children, a son and three daughters, were with him at the time of his death.

HON. SAMUEL WINSLOW.

Hon. Samuel Winslow was born in Newton, Mass., February 28, 1827, and received his early education

*Samuel Whistler*

in the schools of that town. On leaving school he was employed in the manufacture of cotton machinery, and in this occupation he displayed great industry and inventive skill. So rapidly did he advance that at the age of twenty he was made foreman in his shop, with over fifty men under his charge. He removed to Worcester in 1855, and on April 1st of that year formed a co-partnership with his brother, Seth C. Winslow, and started a machine-shop. In the year 1857 they began the manufacture of skates, with which industry he is even now identified. The works were located in the old Merrifield building, in Cypress Street, and they remained there for twenty-one years. At the death of his brother, in 1871, Mr. Winslow assumed the whole control of the business, and continued it alone until the formation of the Samuel Winslow Skate Manufacturing Company, in May, 1886, in which Mr. Winslow retained a majority of the stock, and has since served the corporation as its president and treasurer.

Mr. Winslow began his public career in Newton Upper Falls in the year 1848, as a member of the Prudential Committee for the employment of teachers and the charge of the schools in that village. He was soon after elected clerk of the corporation, which organized the Boston and Woonsocket Division of what is now the New York and New England Railroad.

Mr. Winslow was a member of the Common Council of the city of Worcester in 1864-65. He was a representative from the Tenth Worcester District in the Massachusetts Legislature in 1873-74, and in 1885 served as alderman to fill a vacancy. In 1885 he was elected mayor of the city of Worcester for the ensuing year by a sweeping majority, and has since been elected to the same position for the years 1887, '88 and '89 by very large majorities. His record as mayor has been of the highest order, as is attested by his four successive elections to the position. He was a trustee of the Worcester County Mechanics' Association from 1868 to '71, its vice-president from 1884 to '86, its president in 1886, and declined re-election to the presidency in 1887 on account of his duties as mayor.

In December, 1888, Mr. Winslow was elected a director of the Citizens' National Bank, and at the annual meeting of the corporation in January, 1889, was re-elected a director, and was subsequently elected to the presidency by the Board of Directors. He was also elected a trustee of the People's Savings Bank in January, 1889.

Mr. Winslow is one of the few men of to-day who can trace with pride his continual growth of character in the eyes of his fellow-citizens, and who can look back upon a business career which has been one of steady increase from year to year and prosperous in every sense.

It is now his good fortune to be possessed of a liberal share of this world's goods, and he distributes

them with a charitable but judicious hand. During his whole life he has been very generous, although his acts of kindness have seldom been known by others than those who have been directly benefited. Before he had even reached the age of man's estate Mr. Winslow began his self-sacrifices by depriving himself of a large share of his income for the sake of educating his brothers, although older than himself.

It can be said, in conclusion, that the esteem in which Mr. Winslow is held by his neighbors and fellow-townsmen is due to a life based upon the principles of integrity and industry.

---

JOHN M. EARLE.

John Milton Earle, born in Leicester April 13, 1794, was the eldest of the nine children of Pliny and Patience (Buffum) Earle. His father was the pioneer, in America, in the manufacture of machine cards for the carding of cotton by water, or by some other motive-power than that of the human hand; and an interesting account of his life and work will be found in the history of Leicester in its appropriate place in these pages. Most of the children of Pliny Earle inherited the strong intellectual traits of both of their parents, three of the sons devoting themselves to literary or professional labor. John Milton Earle was educated at the academy in his native town. He was for a few years clerk in the store of the Northbridge Cotton-Mill at Whitinsville, in which his father had an interest; but in 1816 he came to Worcester and, with Anthony Chase, (afterwards his brother-in-law,) opened a "country store" on the north corner of Main and Thomas Streets. In 1823 they purchased the *Massachusetts Spy*, to the columns of which Mr. Earle had already been a contributor, and of which he was to be, for thirty-five years, the editor and principal manager, and for fifteen years of the time the sole proprietor. Mr. Earle was an editor of the same class with Nathan Hale and William Cullen Bryant. Firm in his honest convictions, he was conscious of the responsibility of his position, and he set forth his views with a clearness of style that commanded the intelligent assent of his large circle of readers. The *Spy*, in his hands, was not a party "organ," but was always a little in advance of the conservative judgment of a people second for intelligence to none other in the world. In the best days of the Whig party Mr. Earle, although more radical than they upon the question of slavery, labored to secure the election of its candidates. But in 1848, when his neighbor and friend, the late Hon. Charles Allen, returned from the National Convention at Philadelphia, where he had repudiated the nomination of Zachary Taylor for President, as made for the aggrandizement of the slave power, Mr. Earle, hesitating only long enough to consider if the time was ripe for the new movement which Judge Allen was leading, espoused the cause, and now more heartily than ever

before labored with his pen to secure the spread of the at length accepted doctrine of a free soil and free men.

Associated with Mr. Earle in the conduct of the *Spy*, from 1849-58, was Mr. Thomas Drew,<sup>1</sup> himself a striking character. Mr. Drew, in a letter to the writer of this notice, under date of October 25, 1888, says: "Among the historic characters of Worcester County, Mr. Earle is entitled to a place in the front rank for what he was and for what he did. There is probably no other man living who appreciates as I do his sublime faith in the triumph of a righteous cause, and his heroic, self-sacrificing courage in sustaining it. . . . He had a broad-gauge mind, intensely humane sympathies, and as much self-sacrificing spirit as any of the old martyrs who were burned at the stake. In 1848, after the Buffalo Convention, of which he was a member, I think that rather than recede from the grand position in which he placed the *Spy*, he would have cheerfully fulfilled all the Scripture requirements of a 'burnt-offering.'"

Although Mr. Earle's chief delight was in literary work, he was not a recluse. His keen interest in public affairs led him to accept the unsought calls of his fellow-citizens to hold some of the offices at their disposal. He was a member of the lower branch of the Legislature in 1844, '45, '46, '50, '51 and '52, and State Senator in 1858. During his first term he was able to exert an influence much greater than new members generally acquire. His views in opposition to capital punishment, and the disinclination of politicians to take a decided ground, as he did, on the temperance question, gave him a prominent position. At this session a resolve was introduced, fixing the compensation allowed to counties for the support of lunatics not committed to the State Hospital. The allowance to Suffolk County was to be cut down some two thousand five hundred dollars. The resolve of course met with vigorous opposition from the Boston delegation, who, with the aid of members from other counties which would be similarly affected, succeeded in voting it down. Mr. Earle, convinced that such was to be its fate, voted with the majority and was thus entitled to move a re-consideration. Renewing the contest, he secured the passage of the resolve. The *Boston Post*, announcing the result, said: "Mr. Earle, of Worcester, did this by pertinacious perseverance." At the same session a bill was introduced relating to life insurance. In this Mr. Earle saw a covert hostility to the formation of a life assurance company in Worcester, as was proposed. The bill had a strong backing, and, after passing the Senate, was carried through its first debateable stage in the House by vote of two to one. In the subsequent discussion upon its final passage, Mr. Earle was left to

oppose it alone. But the force of his argument convinced his hearers, and the bill was rejected by about the same majority that had before voted in its favor. In his later years of service he was especially conspicuous in advocating the secret ballot and in securing the election of Charles Sumner to the United States Senate. He was a member of the Convention of 1853 for the revision of the State Constitution. There he advocated the district system of representation in the Legislature and radical changes in the mode of appointment of various officers, taking it from the Governor and giving it to the people.

The recreation of Mr. Earle was found in botany, conchology and horticulture. He was both a theoretical and a practical botanist. His collection of shells, one of the finest in the State, he gave, a short time before his death, to the Worcester Natural History Association. His garden was full of the choicest fruit-trees which he tended with careful hand; and he was a recognized authority on all horticultural matters. He was one of the founders of the Worcester Horticultural Society, and for several years its president.

On a motion of Mr. Earle, offered in a town-meeting, held November 8, 1847, it was voted to petition for a city charter. The charter was granted, and Mr. Earle was elected a member of the first Board of Aldermen. He was one of the vice-presidents of the Worcester County Institution for Savings, and a director in the State Mutual Life Assurance Company from its organization to his death.

In 1859 he was appointed by Gov. Banks, commissioner to examine into and report upon the condition of the Indians and their descendants domiciled in the Commonwealth, for the information of the General Court in regard to their population, their social and political condition, and their educational, religious and municipal organizations. He devoted nearly two years to the task, and in 1861 made an extended report, which is a marvel of conscientious and intelligent investigation, thoroughly performed.

Mr. Earle was commissioned by President Lincoln as postmaster of Worcester, July 16, 1861. He was re-appointed by President Johnson, July 7, 1865. Soon after this date he received a circular endorsing the policy of Mr. Johnson, with a request for his signature. His principles and his conscience alike forbade his signing, and after a second circular had been sent him, which he treated with silence, as he had the first one, his removal from office quickly followed.

Mr. Earle married, June 6, 1821, Sarah, daughter of Tristram and Sarah (Folger) Hussey, of Nantucket. He died at Worcester, February 8, 1874. They had nine children, five of whom survive.

The reader is referred, further, to the volume: "Ralph Earle and his Descendants. Compiled by Pliny Earle [a brother of J. M. Earle], of Northampton. Worcester, Mass.: Press of Charles Hamilton, 1888."

<sup>1</sup> Mr. Drew died at Dorchester, November 12, 1888, aged sixty-nine years. For an account of his life, see the *Boston Herald* and the Worcester newspapers of the time.

Carvin Saff

## CALVIN TAFT.

Calvin Taft was born in Roxbury, Mass., January 29, 1813, his father being Adolphus Taft, of Northbridge, Mass. He entered into a business life at an early age, and when a boy was employed in the store of Peter Farnum, of Farnumsville, Grafton. He afterwards opened a small store in Millbury, Mass., and later returned to Grafton, where he had a store at Leland's Landing, on the old Providence Canal. His natural adaptation to mercantile life was shown by having all this experience before he was twenty-five years of age, for, at that age, in 1838, with the characteristic spirit of enterprise of New England's sturdy, advancing men, he went in search of fields of larger promise. That year found him in the South, at Hawkinsville, Ga., where he conducted a store of general merchandise. He took cotton from the planters, in small quantities, in exchange for goods. Coming in this way to acquire a judgment in the buying and selling of cotton, and getting interested in the trade, he sold his store to devote his entire attention to it, which he did for nearly a quarter of a century. So shrewd had been his management, and so prosperous his labors, that several thousand bales of cotton were in his warehouses when the war broke out, the greater portion of which was lost during the war.

In the spring of 1861, nothing daunted, Mr. Taft returned to the North, and for four years was in the cotton trade in New York City. He then removed to Worcester, Mass., where his financial abilities were recognized—as they had been wherever he had been located. He was one of the first directors of the Worcester Safe Deposit and Trust Company.

Though he ever after retained his residence in Worcester, yet he had large business interests elsewhere. At Holyoke, Mass., he was identified with the Franklin Paper Company, which was organized in 1866, being its first president. The capital stock of the company was sixty thousand dollars, and the producing power of the mill three tons per day of envelope and colored flat papers. Three years later, when the Albion Paper Company was organized by Mr. Taft's son-in-law, Mr. James H. Newton, of Holyoke, he became president of the corporation, and was connected with it till the time of his death. His son, Edward C. Taft, is at present the agent and treasurer of this corporation. This mill produces eighteen tons daily of book-paper, engine-sized flats and cardboards. The capital stock upon organizing was sixty thousand dollars. Mr. Taft's domestic, social and religious life was equally fortunate as was his business career. He was three times happily married. His first wife was Susan, daughter of Jonathan Wadsworth and Tabitha Warren Wadsworth, of Farnumsville, Grafton, Mass. The second wife was Eliza Taft, daughter of Zadok and Abigail Bennett Taft, of Uxbridge, Mass. His third wife, who survives him, is

Cornelia, daughter of Charles Brigham and Susannah Baylies Brigham, of Grafton, Mass. Three children also survive him: Edward C. Taft and Mrs. James H. Newton, of Holyoke, and Miss Jennie A. Taft, of Worcester. Calvin Taft died at Worcester, June 17, 1881, at the age of sixty-eight years, and left, besides, a good name and a large fortune (twenty thousand dollars) in public charities by will. He left a five thousand dollars bequest to Piedmont Church, of Worcester, with which he had long been identified and through which, in his lifetime, benefactions for the needy had found their way from him. His life was one, not only of usefulness, but of genial, quiet manner and kindly deed, a Massachusetts business man whose memory will be always cherished by his many friends.

## JOSEPH HENRY WALKER.

Mr. Walker was a son of Joseph Walker, a native of Hopkinton, Mass., and Hannah Thayer Chapin, of Milford. On their marriage they took up their residence in Boston, and there the subject of this sketch was born on the 21st of December, 1829. In February, 1830, the family returned to Hopkinton, and in 1843 removed to Worcester.

Mr. Walker was educated in the district and High Schools of Hopkinton and Worcester, leaving school when sixteen years old. In May, 1852, he was united in marriage with Sarah Ellen, daughter of Jubal Harrington, of Worcester. She died in August, 1859, leaving a daughter, now the wife of the banker Milton Shirk, of Peru, Indiana. His second wife, Hannah M. (Kelley) Spear, of New Hampton, N. H., he married in April, 1862. By her he had three children: Joseph, now in Harvard Law School; George, now in Brown University, and Agnes, the wife of Adams Davenport Claflin, son of ex-Governor Claflin, of Massachusetts.

Mr. Walker has filled offices of trust and responsibility, some of a political, some of a financial, and others of varied character. At the age of twenty-three years he was elected to the Common Council of Worcester, of which body he was president in 1869; was a member of the Massachusetts House of Representatives in 1879, '80 and '87, serving on the Retrenchment Committee in 1879; was chairman of the Public Service Committee in 1880, and in the latter year was a strong, though unsuccessful, candidate for Speaker. He was chairman of the Committee on Labor in 1887, and second on the Committees on Finance and Expenditure.

He was for several years president of the Worcester Board of Trade, and chairman of the Committee on Foreign Trade and Exports of the National Hide and Leather Association for several years, and also vice-president of the New England Shoe and Leather Association.

Mr. Walker has written and spoken considerably upon questions of trade, banking and coinage, pub-

lishing in 1881, through Houghton, Mifflin & Co., of Boston, a monograph entitled "Money, Trade and Banking," which attracted a good deal of attention. and received high encomiums from leading bankers and writers on finance.

Mr. Walker was one of the leading boot and shoe manufacturers in the country from 1851 to 1887, at which time he retired from that business. He is still the senior member of the large leather-house of Walker, Oakley & Co., of Chicago, Ill., which he established in that city in 1868.

The city of Worcester, together with thirty-two adjacent towns in Worcester County and three in Hampden County, compose the Tenth Congressional District of Massachusetts; and from this district Mr. Walker was elected a Representative to Congress on the 6th of November, 1888.

Mr. Walker has great energy and uncommon talent for organizing and administering business affairs, which have given him success as a manufacturer and a large property. His public spirit and liberality have been shown conspicuously in his relations with Worcester Academy, whose present prosperity is due, in great measure, to his generous gifts and his valuable service as president of the Board of Trustees. He has given liberally also to other good objects, and his counsel and aid have always been at the command of any wisely-conceived undertaking to promote the prosperity of the city or the well-being of its people. In public as in private matters he is one of those men who bring things to pass. And though his quickness of perception, independence of character, zeal and activity, his frank and emphatic manner of speech and his impatience sometimes with those less prompt in decision and action have caused him to be regarded as unduly masterful, he has been and is a great and valuable force in the political, municipal, industrial and social life of Worcester.

---

JOHN EDWIN SMITH.

Mr. Smith is a native of Shirley, Middlesex County, and was born on the 21st of August, 1832. He received an academic education, and while still in early life entered upon that business career which has been on the whole one of very marked success, not that he has been entirely, or in a much greater degree than others, exempt from the vicissitudes that are incidental to business life,—that life which in all its phases is exposed to the wiles of the deceitful and untrustworthy, the failures of the incompetent and the numberless hidden dangers that interrupt the progress of one who climbs the ascent of fortune's hill. Now, however, at an age verging on three-score years, he has the satisfaction of finding himself in affluent circumstances, and at the head of a business still flourishing and with bright prospects for the future.

Mr. Smith's business is cotton manufacturing, one

of the industries that has made Worcester what she is. And the growth and development of his business during the series of years that he has been numbered among her citizens is but typical of the growth and development of the city itself. His has been emphatically a business life, undisturbed by aspiration for political distinction or for any of the public positions which have such damaging attractions for so many of us. But he has not been one to shun the common duties of good citizenship, or refuse to bear his full share in the obligations and burdens necessary to perpetuate its blessings. In public affairs, however, he has never been demonstrative, but quietly, by his vote, by his liberal contributions and sound suggestions, has performed his part. Though not an active politician, and never a political office-holder or office-seeker, he has yet decided opinions on local as well as national topics, is never averse to expressing them, and, if need be, giving his reasons for their maintenance. As far as party affiliation is concerned, he is a firm adherent of the present Republican party, an uncompromising advocate of their principles and policy.

Though not what is popularly known as an office-holder, he has yet for many years filled places of the highest trust and responsibility in institutions of importance and usefulness, such as that of president of the Mechanics' Savings Bank, director in the Mechanics' National Bank, director in the Central Massachusetts Railroad and trustee for the bond-holders of the Worcester, Nashua and Rochester Railroad. He has likewise been postmaster of Smithville for the last twenty-nine years and still holds the office. In these and in some others, where financial skill and trustworthiness are of the first importance, his management and influence have been productive of most beneficial results.

In religious sentiment Mr. Smith ranks as a Unitarian, but is ever willing to accord to those of different views conscientiousness and a faithful regard for truth. He has been twice married, his first union taking place January 1, 1864; and all his children—three sons and one daughter—are now living.

Mr. Smith is a thinking rather than a wordy or demonstrative man; but his reserve, if such it may be called, is not tinged by moroseness and he is not given to misanthropic croakings. His intercourse in public is frank and confiding, and his social and domestic habits are such as to secure a large circle of appreciative and sympathetic friends. His residence is among the finest in Worcester, and both within and without affords ample evidence of refined taste and abundant means—a home where the endearments of domestic life find full fruition.

---

PHILIP LOUIS MOEN.

One of the most prominent business men of Worcester, for the last twenty-five years, has been the individual whose name appears above. He is presi-

*J. Edwin Smith*

*Warren Williams*

dent of the notable Washburn and Moen Manufacturing Company, which will be found spoken of in other connections, in the present work, as one of the largest, if not the very largest, manufacturing concern in the great manufacturing centre, Worcester. Indeed, it is said to be the most extensive wire manufacturing company, under individual ownership and management, in the whole world.

Mr. Moen was born in Wilna, N. Y., November 13, 1824, and was a son of Augustus R. and Sophie Ann Moen. His initiation into business life was in a hardware store in New York, in which wire from the Washburn mill in Worcester was sold; and not long after he became acquainted with a daughter of Deacon Ichabod Washburn, the originator and proprietor of the business, and married her in 1846. The next year he settled in Worcester, and the firm I. Washburn & Moen was formed, the business being wire-drawing and rod-rolling. This was when Mr. Moen was about twenty-three years of age. And the business has continued essentially the same. But in 1868 it began to be carried on under the name of the Washburn and Moen Manufacturing Co., the corporation being established by legislative act. The business has steadily increased till at the present time it has reached gigantic proportions. They now employ some three thousand workmen, and turn out about two hundred and fifty tons daily. They manufacture wire, in great variety, of copper, steel and iron; and of all sizes.

The matrimonial alliance of Mr. Moen seems to have had most satisfactory results, beyond the circle of home and domestic life, for Deacon Washburn writes in his diary, 1866: "In 1850 I took as a partner my son-in-law, P. L. Moen. In him I have had a most efficient aid in bringing up the business to its present mammoth size. While he makes no claim to be a practical mechanic, he has, by his exactness, promptitude and aptness for business generally, supplied a deficiency in myself indispensable to success. He has managed with rare ability our finances, a department of the business for which I never had the taste or inclination."

Mr. Moen, though not a college graduate, nor one claiming special advancement in book learning, is yet a man of much intelligence and elevated thought, a judicious and active friend of all approved educational movements and institutions, and one ever ready to further his views by liberal contributions. His services on the School Board have been highly appreciated, and as trustee of the Worcester Polytechnic Institute, since 1869, and treasurer of the same for seven years, he has so acquitted himself as to merit and receive the highest approval.

In the more active scenes of political life he has not been much found, though on public questions his views and sentiments have had decided expression and due weight. In 1885 he was chosen a Presidential elector on the Republican ticket, a fact which sufficiently indicates his party affiliation.

In social life he is regarded as a conscientious Christian gentleman, a man of genial disposition, kindly sympathies, and ever ready to give efficient aid to all true moral and benevolent enterprises. In religious sentiment he is of the New England orthodox Congregational stamp, and well known for his broad Christian characteristics.

Mr. Moen has been twice married, his first partner having been a daughter of Deacon Ichabod Washburn, as before stated, and his second Maria S. Grant, of Chelsea, Vt. Three children, by the last marriage, one son and two daughters, are now living.

#### WARREN WILLIAMS.

As a type of rugged manhood of the old-time New England quality, in its triple union of moral, mental and physical stamina, Warren Williams would be a marked man in any community.

Decision of character, tact and sagacity are indicated in every line of the strong, earnest face, and when united with his stalwart figure, still erect and supple at nigh four-score years, the picture is complete of a man born to achieve success in business, and to command the confidence and respect of his associates.

With fewer opportunities, and less ability to turn them to his own advantage, he would still have been a successful man by virtue of his native instincts of thrift and perseverance, habits of industry and temperance in all things.

With a well-balanced temperament, conservative, but never timorous, naturally sagacious and enterprising, but willing to work with his hands until a sure foundation had been laid for the future, it is not strange that he was able to retire from active business and enjoy a quarter of a century of freedom from other than voluntary task.

Warren Williams, the son of Simeon Williams, was born in Woolwich, Me., July 2, 1811. His mother was Lydia Young, whose family, on the maternal side, was near of kin to Alexander Hamilton.

The family consisted of nine children—one daughter and eight sons—one of the latter being the late Judge Hartley Williams, for many years an honored citizen of Worcester, who died in 1882.

Early in life Warren Williams learned the carpenter's trade, and moved to Leicester, Mass., in 1830.

In 1836 he came to Worcester to engage in the woolen machinery business, then conducted by L. & A. G. Coes, and later by Henry Goulding, with whom he remained for fourteen years, rising from a workman's bench to the position of foreman and superintendent, until 1851, when he became joint proprietor, with Fitzroy, Willard and others, under the firm-name of Willard, Williams & Co.

The business was then located on the corner of Union and School Streets, on the premises now oc-

cupied by N. A. Lombard & Co., and proved successful.

In 1854 Mr. Williams withdrew from the firm, and retired to a farm in the north part of the city, where he resided for a number of years.

In 1858 he bought Charles Ballard's interest in the firm of Ball & Ballard, manufacturers of wood-working machinery, and continued this branch of business under the firm of Ball & Williams until 1861.

On the breaking out of the Civil War they added the manufacture of the Ballard Breech-Loading (Carbine) Rifles, invented by Charles Ballard, the former partner.

The demand for arms of this kind, created by the war, enabled the firm to dispose of their whole product to a single firm of purchasing agents for the State of Kentucky during the entire period of the war. The business proved very lucrative, and Mr. Williams retired from the firm in 1865, with a competence, and has not since been engaged in active business.

He has not, however, been idle, having found ample field for mental activity and usefulness, in congenial duties connected with the banks and other corporate interests with which he has been associated.

For more than fifty years he has been a member of the Union (Congregational) Church, always prominent and active in parish matters.

He was the treasurer of the Building Committee when the present edifice was built, and for many months devoted his personal attention to the superintendence of the work.

One of the original members of the Mechanics' Association, he has been a life member for over thirty years, and has filled various offices in that organization.

As a member of the Legislature he was actively interested in procuring the charter for the People's Savings Bank, and has been on the Board of Trustees of that bank for over twenty years, rendering valuable service on the Financial Committee, and is now one of the vice-presidents of that institution.

He has also been a director of the Worcester Safe Deposit and Trust Company for the past fifteen years, and for about an equal period he has been identified with the management of the Worcester Protective Union as the chairman of its Board of Trade.

He has recently been chosen one of the auditors of the Providence & Worcester Railroad Corporation.

Always a man of strong political convictions, and staunchly Republican, he is as nearly devoid of political ambition as it is possible for a man to be, and although frequently urged to accept public office, he has steadfastly shunned its honors and responsibilities for the past twenty years.

He has, however, served four terms in the State Legislature as a Representative from Ward 8, in the years 1863 and '64, and in 1868 and '69.

During his first term of service the Hon. Alexander H. Bullock was the Speaker of the House, and during his second term his neighbor and townsman was the Governor of the Commonwealth.

It is a matter of record that Mr. Williams was regarded as the Speaker's and Governor's right-hand man as a member of the Committees on Finance and Claims, in all legislation touching the economic administration of the government.

Warren Williams married Harriet M. Whittaker, of Princeton, Mass., in 1838, and the fortunate couple celebrated their golden wedding anniversary on the 16th of May last.

They have two children—a daughter, the sunshine of their declining years, and a son, Charles Austin Williams—the trusted and genial assistant cashier of the City National Bank, with which institution he has been connected for twenty-three years. Two grandchildren—Haskell and Warren, sons of Charles—represent the third generation and perpetuate the name.

Descended from a line remarkable on both sides for longevity, Mr. Williams is still hale and hearty, with his faculties undimmed, although now in his seventy-eighth year.

#### GEORGE SUMNER BARTON.

Among the most extensive manufacturing establishments in Worcester is that known as the Rice, Barton & Fales Machine and Iron Company. The number of workmen employed is large and the products are favorably known in all parts of the country. Mr. Barton, whose name appears at the head of this sketch, was elected president at the time the company was organized under the act of incorporation, in 1867; he had, however, been connected with the business from 1845, at which time he entered as an apprentice. In the latter capacity he faithfully served his time, and step by step came to be, at the age of twenty-four, a partner. At present the manufactures are chiefly of machinery for paper-making and for printing calico, delaines and woolens, for hydraulic presses and other similar heavy iron work. The business is among the most extensive and prosperous in the city.

At the time Mr. Barton first came Worcester was but an insignificant place compared with what it now is. But she was always fortunate, above most other places, in having among her people individuals conspicuous in various so-called upper walks of life—individuals who gave her a wide reputation and distinguished name. And though at the present time she can number among her citizens those well-fitted to sustain her reputation for statesmanship, for learning and social culture, it may yet be questioned whether she is not fast approaching that period in her history when she will be best known for her achievements in the industrial pursuits; for her great

*John D. Lovell.*

and varied mechanical works; for her many useful inventions, and her countless ingenious labor-saving contrivances. Which class of individuals alluded to—the learned or the mechanical—will prove most conducive to her prosperity and final greatness the writer is not competent to predict.

It is not wise, perhaps, to make comparisons among those to whom Worcester is so greatly indebted, in a mechanical way, where so many appear on almost the same footing. But of the individual whose name is placed above it may be said, without detracting aught from any other whose name stands high on the roll of useful citizens, that his integrity of character and his career of industry, perseverance and self-discipline furnishes an example that may be profitably followed by every young man who aspires to a position of thrift and respectability like that which he now occupies.

The services of Mr. Barton have been in requisition from time to time in public offices where quick apprehension, good judgment and prompt action were necessary. He has served several terms in the Common Council and likewise in the Board of Aldermen; has been a Legislative Senator, and in various offices of a more private character, like that of railroad director and president, and as trustee, vice-president and president of the County Mechanics' Association has rendered valuable service. In all the various official positions he has consented to occupy he has acquitted himself with honor and to the satisfaction of his constituents.

Mr. Barton was born in the picturesque town of Millbury, on the 18th of July, 1825, and is yet in the vigor of manhood. His education was better than that of several other prosperous individuals named in the present work, inasmuch as he added to his district school training an academic course. His father, Rufus Barton, was the parent of nine children, George S. being the youngest. At the age of twenty he left home and immediately applied himself to learning the trade of machinist—the trade which of all others was no doubt best fitted to his genius and inclination, a fact which his subsequent uniform success has abundantly verified. We find him now, in the vigor of manhood, a person of dignified presence and genial manners, liberal in his views, and maintaining towards all classes the bearing of a gentleman. In politics he has always been a pronounced supporter of the principles of the Republican party.

It was not, however, in the manufacturing line which has here been chiefly spoken of that Mr. Barton's skill, shrewdness and various talents have been exclusively exercised. In other pursuits he has been active, ever exercising those peculiar qualities that are sure, in the absence of casual interference, to lead on to fortune.

He has been an extensive traveler; not so much in other quarters of the world as in our own country.

If he has not visited every State and Territory of the Union, he has almost every one, as well as some of the neighboring islands,—Cuba and Vancouver among the number. And having circulated among the more intelligent classes, with his observing and inquiring mind, he has stored up a fund of valuable and available knowledge, which he knows well how to use for himself and healthfully dispense to others.

Mr. Barton has had a son and daughter. The son, Charles S. Barton, is now president of the company of which his father is treasurer.

---

JOHN DANA LOVELL.

Mr. Lovell was born in Worcester on the 30th of April, 1818, and was the eldest son of Cyrus and Lois Lovell, then occupying a farm on the outskirts of the town; and until he was thirty-eight years of age he pursued the vocation of husbandman as his chief employment. His advantages for education were quite limited, the District School, with a year at Phillips Academy, Andover, supplying about all that he could gain. He taught two terms, after which, at the age of twenty, he settled on a farm.

When he had arrived at the age of thirty-eight Mr. Lovell disposed of his farm and stock and moved into the town, which had then adopted the city form of government. Here he continued somewhat in the agricultural line by establishing an agricultural warehouse and seed-store. This was in July, 1857; and he followed the business nearly a score of years, or until October, 1875. At the latter date, having been so successful as to accumulate such a fortune as was deemed sufficient for all necessary wants and reasonable desires, he retired from busy mercantile pursuits, and has since lived a life of ease, so far as the cares, perplexities and annoyances of active business are concerned. But he has by no means passed his time in "inglorious ease," without taking part in the manifold works of charity and benevolence, in which every true philanthropist delights to engage, and in which, at all times, there is enough to do. In all such works he has been active and liberal, to a degree that has received the merited applause of every well-wisher to the community.

During these latter years, however, he has had much to do in a line that requires prudence, judgment and no small amount of patience. The line here alluded to is that connected with the care and disposal of estates as trustee, executor or administrator. He has had much of this kind of business in hand, and has succeeded in settling matters to the satisfaction of all reasonable parties concerned, which is saying a great deal, where so many conflicting interests and jealousies are liable to intervene to the entanglement of claims and interests and the disturbance of the peace of families.

And then, in other offices of honor and trust, he has employed many hours of labor and anxiety in

the endeavor to secure what was equitable and right between man and man. He is a director in the First National Insurance Company, a trustee in the Mechanics' Savings Bank, a trustee in the Rural Cemetery Association and a trustee in the Horticultural Society of Worcester County. His duties in these positions, and others not named, may well be supposed to require such unremitting attention that he can have little time to devote to indolent ease. He is not a shirk, as too many of us are liable to be in offices to which no pecuniary reward is attached.

As may well be imagined, with his time so filled, little could be spared for politics and the stirring affairs of public life; and, besides, his natural taste does not lead that way. He, however, never shrank from the duties that he felt it incumbent to assume. In 1867 and '68 he was an alderman, and in 1877 and '78 he was a Representative in the General Court.

As a party adherent Mr. Lovell was an old-time Whig; on the disruption of that organization he became a member of the Free Soil party, and thence passed into the present Republican party, in which he still remains, ever ready to liberally contribute for the maintenance of principles which commend themselves to him as best adapted to the general good.

In religion Mr. Lovell has always adhered to what is popularly known as the orthodox faith,—in other words, the faith of the old New England fathers,—the Trinitarian Congregational. And he has for these many years been so prompt in his religious duties and so liberal in his contributions for the maintenance of public worship, as well as all approved charitable and benevolent enterprises, that he will be sadly missed when the hour for his final withdrawal arrives.

Mr. Lovell has been twice married. His first wife was Eleanor Winch, with whom he was united April 18, 1843, and who died April 26, 1882. His second wife, whom he married November 20, 1883, was Mrs. Ellen C. Bigelow, widow of Samuel T. Bigelow, and who was the mother of two daughters at the time of her marriage with Mr. Lovell, which daughters and their mother are still living.

A life so full of activity in business and in the performance of social duties as that of Mr. Lovell may well merit a more extended notice than is here given, at least for the sake of example. But some men are so sensitive as to having their trumpets blown, as the vulgar expression is, that one who would willingly accord what is really due is restricted and admonished. To most of us a lively blast on the trumpet of praise now and then is quite refreshing, but Mr. Lovell is not one liable to appreciate laudation, and so no further attempt will be made to thwart his expressed desire.

#### EDWARD EARLE.

Edward Earle was born in Leicester, Mass., February 10, 1811. He was the fifth generation from Ralph Earle, who was one of the pioneers who settled in Leicester in 1717, and the seventh from Ralph Earle, who came from England about 1630. His father, Timothy Earle (a successful card-maker, like his brothers), was the fifth son of Robert Earle, Jr., whose five sons all settled on neighboring farms in sight of the paternal home. His mother was Ruth Keese, from Peru, N. Y., to which place she removed from Dutchess County, N. Y., with her parents, when but four years of age, her father having purchased a large tract of land in the then wild region around Lake Champlain. Her mother was a talented member of the Halleck family and an intimate friend of many of the prominent personages of her time. From his mother's side he inherited, mainly, "that calmness and soundness of judgment" which were among his chief characteristics.

His father died when Edward was about eight years old, and his mother afterwards married her husband's brother Henry, who, being an invalid for a great part of his after-life, the care of the large farm and the management of the saw-mill upon it devolved upon Edward at a very early age. Here he developed those traits of industry and thrift which were natural to him and which were conspicuous throughout his life. He attended the district school and the academy in Leicester, and completed his education at Friends' School in Providence, R. I. He subsequently taught the school in the district in which he lived. In 1832, soon after he had attained the age of twenty-one, he went to Worcester, Mass., and became engaged in mercantile business, temporarily as clerk in the flour and grain store of his cousin, Robert Earle, and afterwards in co-partnership with Gen. Nathan Heard.

On the 1st of October, 1835, he married Ann Barker Buffum, daughter of David and Susan Ann Buffum, of Middletown, R. I., a woman of great intelligence and decision of character, who joined heartily with her husband in the enterprises of benevolence and philanthropy which engaged so much of his time and attention.

Their only child, Anne Buffum Earle, married, in 1865, James S. Rogers, now of Rockport, Mass.

Before his marriage, in 1835, he had left the flour business and had become connected with Joseph Pratt, under the firm-name of Pratt & Earle. This house was for many years more extensively engaged in the iron and steel business than any other in Worcester County, and he retained his interest in it long after the establishment and the assured success of his additional business, as the senior member of the firm of T. K. Earle & Co.

Soon after the death of his uncle, Silas Earle, in 1842, his brother, Timothy K. Earle, then in his minority, purchased an interest in the machine-card business of their late uncle, and after two changes in

the firm, in a very brief period, Edward bought the interest of his cousin Timothy, and a co-partnership was formed with his brother Timothy K., under the title of T. K. Earle & Co., which continued until his retirement in 1869. For a short period after embarking in this business it was continued in the Silas Earle factory in Leicester, and then removed to Worcester.

After his retirement from the firm of T. K. Earle & Co. he took no active part in business, although his time was fully occupied with his real-estate interests, and in the management of public and private trusts. His public life began in 1843, as a member of the Board of Selectmen of the town of Worcester. In 1851 he was a Representative in the State Legislature—the memorable year in which, after an “earnest and protracted struggle,” Charles Sumner was elected Senator to the Congress of the United States. In 1853 he was a member of the Board of Aldermen of the city of Worcester, and from 1861 to 1871 he was a member of the School Board of the city, resigning his office in 1871 to accept the mayoralty, to which he was elected to fill the vacancy caused by the death of Hon. James B. Blake.

While on the School Board he was a zealous advocate of the introduction of drawing into the public schools, was interested in the Training School, and afterwards in the establishment of the State Normal School. “He was always prompt in attention to business and level-headed, while not too conservative.”

As Mayor, he was an “honest, faithful and honored public servant, careful of the rights and property of the citizens; infusing by his personal presence and the purity of his private character into every department of the city government the ideas of honesty, justice and frugality. His motto seemed to be ‘Substance, and not Form,’ and this idea pervaded his acts through life. His was a most illustrious example of that pure, original Quaker simplicity which adorns and beautifies, while it ennobles and Christianizes everybody and everything with which it comes in contact.

“He always bore the burdens and honors of public office with quiet and unostentatious dignity, and labored with his full ability faithfully to discharge all its trusts and duties. At the time when the Government was seeking new methods of dealing with its wards on the frontier, he was selected by the Society of Friends as one of the Indian Commissioners, to act in consultation and connection with the commission appointed by the President. He personally visited the Indians in their places of abode, studied their condition and needs, and pressed his opinions with the vigor of one who knew whereof he spoke.”

He was interested in the anti-slavery movement from the beginning. The wrongs and sufferings of the negro always worked upon his sympathy to a great extent, and his mind was busy with schemes

for the amelioration of the condition of the race generally, or for some individual member thereof. It was not unnatural, therefore, that after the proclamation of emancipation was issued, he should seek to do something to help the colored people to take their proper place in the State and community. He was very early made one of the committee of New England Friends to investigate as to the most desirable place to establish a Freedman’s Mission. To this end he, with others, visited various points along the line of division between the North and South, calling upon General Grant at his headquarters and making other interesting visits. Washington was chosen as the point for the operations of the committee. He spent weeks and months there at different times attending to the interests of the mission. After that particular enterprise was abandoned, he continued to contribute to the good work through other schools, although he never took active part in the management of any other. He was also, for many years, a member of the committee in charge of the Friends’ denominational school in Providence, R. I.

As a member of the State Board of Charities, and in his later years its chairman, he found a place where the innate tendency of his character, his earnest conviction, clear insight and philanthropic heart made him of more value than men of more shining talents and of restless ambition could have been. He had no theories to defend; no cumbrous equipment of book-learning or class-prejudice in which to encase himself against the impressions of the heart,—the call of duty and of reason. He gave himself wholly to the monitions of the “inward voice,” following as that directed, no matter what might be the outward condition. This is a high quality, sure to give dignity to the conduct and opinions of men in whom it appears; and in Edward Earle it was tainted neither by self-conceit nor by any morose, suspicious or grudging sentiments. He was a plain, good man, with a serious kindliness of mien, and in spirit one of those

“Religious men who give to God and men their dues.”

In his religious sympathies he was with the Society of Friends, in which he was an active and prominent member. He was a Friend, indeed, worthy of the name which the followers of George Fox, with modest discrimination, had chosen for themselves.

His youth and middle life were laborious and successful. No dollar of his wealth was unjustly earned, or left harm or wrong behind in the earning. He did not crave excessive riches, but retired in due season from the accumulation of wealth to what was more consistent with his plan of life,—the moderate and benevolent use of it. He was a faithful steward of what was entrusted to his care, and no small part of his means, as well as of his time, was given to public uses or in acts of charity. The catalogue of

his good deeds is too long to be written on earth, and no man took less pains to publish them. Of his public employments none were very conspicuous. Such he never sought, being more anxious to put his shoulder to the wheel than to ride in the cushioned seat.

It is worth mentioning that he was one of the founders of the American Social Science Association, having signed the call for the first meeting in 1865, and having been a constant member afterwards, though seldom taking part in any but the business meetings. In this, as in many of his other affairs, his wife was one with himself, and they were earnest from the first that women should have a place in the government of the association, which has always been the case. In person he was tall, robust and fine-looking. He generally was blessed with excellent health; but when a severe cold, taken in a damp, unheated car, on a raw spring day, developed into pneumonia, his system failed to rally from the disease, and he quietly passed from this life on the 19th of May, 1877, in the sixty-seventh year of his age. His connection with many and varied interests, and the esteem in which he was held by the community led to very general expressions of respect and sorrow in the public prints, from which, and from "Ralph Earle and his Descendants," by Pliny Earle, M.D., of Northampton, Mass., the foregoing account is mostly taken.

#### TIMOTHY KEESE EARLE.

Of the many beautiful mansions that adorn the picturesque heights of Worcester, and by their solidity of construction, well-chosen and commanding situations, invite the notice of the passer-by, few equal that reared by the subject of this sketch. It is of stone, in a stately architectural style, almost baronial in proportions, and commands interesting views of the city and surrounding country.

As the stranger pauses to admire this elegant abode he naturally desires to learn something of the one by whom it was reared. To his many friends, and to the great body of his fellow-citizens who knew him in life, his history may appear almost too familiar to need recapitulation. He was born in Leicester, Worcester County, on the 11th of January, 1823, was a son of Henry and Ruth Earle, and a lineal descendant of the seventh generation of Ralph Earle, an early settler of Leicester. The great-great-grandfather of Mr. Earle was also named Ralph. He was a noted artist, and is supposed to have produced the first widely-known historical paintings in this country, being four views of the Battle of Lexington. After the Revolution he went to England, studied under West, and became a member of the Royal Academy. Among his works while abroad was a portrait of King George III. After his return, in 1786, he exercised his skill in illustrating various

interesting scenes in American history and scenery, as well as painting a number of portraits of eminent men of the time, among them those of President Dwight, of Yale College, and Governor Strong, of Massachusetts. This Ralph's brother James was also an artist of note, but chiefly confined himself to portraits. Several other members of the old Earle family of Leicester might be named, did space allow, and much added regarding their skill in the mechanic arts, their inventions and their enterprise, all which would tend to show that it was and is a family to which the industrial community, and all others in fact, are greatly indebted.

But it is to the late Timothy K. Earle, who died on the 1st of October, 1881, at the age of fifty-eight years, and whose portrait appears in connection with this sketch, that our remarks must chiefly apply. As before stated, he was born in the good old town of Leicester, January 11, 1823. He obtained the rudiments of education in the common village school, was subsequently a pupil in Leicester Academy and in the Friends' School in Providence, R. I. And though he did not professedly become what the world calls a scholarly man, he was yet competent to take an intelligent part in the discussion of the higher topics of the day. He became a resident of Worcester in 1842.

Mr. Earle was twice married, his first wife having been Nancy T., daughter of William E. Hacker, of Philadelphia, the marriage taking place September 12, 1849. By her he had five daughters and one son. Two of the daughters are now living—Marianna M., wife of Edwin Brown, of Worcester, and Nancy H. His second wife was Caroline C., daughter of Daniel Osborne, of Dover, N. H. By her he had three children, two of whom, Daniel Osborne Earle and Caroline Earle, are now living. The beautiful homestead is still occupied by the family, its many objects of refined ornamentation, the accumulations of wealth and taste, rendering it an enviable home, with only the recollection of the loss of the revered head of the household to mar the enjoyable serenity.

In a carefully-prepared family history, entitled "Ralph Earle and His Descendants," compiled by Pliny Earle, of Northampton, is given a concise account of the business career of Mr. Earle, from which the following is quoted: "He lived with his parents, and when not at school assisted upon the farm until after the decease of his uncle, Silas Earle, when he purchased, in company with Reuben Randall, the card-setting machines, which had contributed very largely to the growth of the estate left by Silas. The several changes of ownership of Randall's interest followed that purchase, until the final formation of the firm 'T. K. Earle & Company,' with Timothy K. and his elder half-brother, Edward Earle, as the sole co-partners, together with the removal of the business to Worcester, have also been mentioned. When this company was formed Timothy K. was still in his min-

*William H. Heywood*

ority, and neither of its members had any practical experience in the business. But Timothy K. was endowed with a large share of that mechanical ingenuity which had previously appeared in several members of the family. He was quick of perception, apt to learn, industrious, energetic and persevering, and not devoid, withal, of a justifiable ambition, while Edward was a careful and prudent financier, who had acquired a knowledge of mercantile principles and methods from his experience in another line of business, and who possessed a constitutional calmness and soundness of judgment matured by years and improved by practice."

Thus equipped at the beginning, Timothy K. devoted himself to the work with a degree of assiduity and activity indicative, not only of a mind which acknowledges no criterion but success, but prophetic of the assurance of that success. It is not our intention, as not necessarily our province, to give a detailed account of the business of T. K. Earle & Company, or the steps by which their establishment was enlarged, until it became, as it still continues to be, the most extensive of its kind in the United States. Edward Earle retired from it in 1869, and his interest was purchased by his half-brother, Thomas, who died in 1871. In 1872 Edwin Brown, of Worcester, son-in-law of T. K. Earle, became a partner, and in 1880 a company, under the name of "The T. K. Earle Manufacturing Company," was organized with T. K. Earle as president and Edwin Brown as agent and treasurer. Of Timothy K. Earle it has been justly said: "Quick to recognize ability in others, and to appreciate what was needed in his business, he always associated with himself employees and mechanics of only the highest ability."

Mr. Earle was long an ardent advocate of temperance principles, was a liberal contributor to that and other reformatory and benevolent causes, and his exertions were so highly appreciated, and the reliance on his ability and integrity so great, that the "Prohibition" party, in 1880 and '81, nominated him for the office of Lieutenant-Governor.

In religious sentiment Mr. Earle adhered to the Society of Friends, actively participating in their business meetings, and being sometimes a speaker in their worshipping assemblies.

The extensive business relations of Mr. Earle drew so largely upon his time and attention that he had little to spare for the duties of public office, for which, indeed, he had little taste or inclination. He served in hardly any office, excepting that of School Committee.

WILLIAM HENRY HEYWOOD.

Mr. Heywood was born in Worcester on the 14th of April, 1817. He early became aware that his success in life depended on his own exertions, and, without a murmur at the apparently more fortunate situation of others, or a shade of envy, addressed himself

bravely to the work before him. From the time he was able to wield the hoe and rake until seventeen years of age he labored on a farm, during which time he availed himself of the opportunities afforded by the district school to procure such education as would be required in the position he was probably destined to occupy. Not only was this accomplished, but the foundation was laid for such after-acquirements as now enable him to maintain a most creditable standing.

At about the age of seventeen years Mr. Heywood began his apprenticeship at carpentering. Apprenticeship in those days was very different from apprenticeship at the present time, and it may not be invidious to claim that while the labors and hardships of the apprentice of the old time were more burdensome than they could be now, more thorough instruction and discipline were acquired. The employment of machinery nowadays in every department of mechanics and its adaptation to every detail has rendered much of the former personal skill obsolete. Mr. Heywood was a well-instructed workman, and successfully pursued the business of carpenter for some twenty-five years—till 1853. He then engaged in other occupations, that demanded less personal exposure.

After retiring from his earlier pursuits and being in more independent circumstances,—not, indeed, where entire leisure could be indulged in, but circumstances in which his services were not in such constant and imperative demand,—he felt at liberty to accept various duties of a public nature: duties which, though unsought, he could not well refuse. He has been from time to time in the service of the city, and always merited and received the approbation of his constituents by his judgment, skill and carefulness. He served as street commissioner two years and as a member of the Common Council four years. And though in the latter office he did not pose as an orator, his diligence and wise suggestions did not fail to receive the approval of his fellow-citizens.

In various capacities, too, of a semi-public character he has served the interests of the community. He has been much employed in appraising estates and administering estates of deceased persons. And in these, as every one knows who has had much to do in that line of business, great care and patience are required to elucidate complex interests and decide conflicting claims. The best evidence of his success in all matters of this kind is, perhaps, to be found in the circumstance of his having so many and such urgent calls for his services.

Mr. Heywood early imbibed a love for reading, and many a delightful and profitable hour has he spent in following out the thought or suggestion of some approved author. And now, in his advanced years, he finds much satisfaction and solid comfort in the habit so long indulged.

In his religious sentiments Mr. Heywood has ad-

hered tenaciously to the faith of his fathers—the Trinitarian Congregational; or, as it is now most commonly called, the Orthodox—and for many years has been a consistent and liberal-handed member of the Old South, or First Congregational Church of Worcester.

Mr. Heywood was united in marriage, December 31, 1844, with Mary G. Sutton, of Worcester. And the fruit of the union was six children, only two of whom (both married daughters) are now living.

It is seen by the foregoing that the life of Mr. Heywood has not been an eventful one. But it is such an one as many who have made a more conspicuous figure in the world, would wish, at the last, they had imitated. By example it attracts and by example it warns, thus accomplishing a most worthy end. To such men it matters little whether or not the trumpet of fame sounds along their path in life, for they realize that its keenest blast can never reach the other shore.

#### DAVID WHITCOMB.<sup>1</sup>

David Whitcomb was a son, and a true son, of that steadfast commonwealth, the Granite State. Rugged, solid, unhewn, and down out of sight, he was a foundation man and men builded upon him. He came of sturdy stock. John Whitcomb was his earliest ancestor in America and with his wife Frances was living in Dorchester, Mass., in 1638. Removing to Lancaster in 1654, he there died in 1662, leaving his widow to survive him for nine years longer. From this original pair the line descended through three generations of Jonathans to Abner who was in the 5th from John and was the ninth child of his parents. Abner Whitcomb was a man of remarkable physical vigor. Born on the 4th of February, 1733, he outlived three wives and married a fourth on the 21st of February, 1806, when he had just entered upon his 73d year. The name of his fourth wife was Abigail Boynton. When her husband was seventy-five years old, their only child, the subject of this sketch, was born. The place of his birth was Hancock, the westernmost town in the county of Hillsborough. Abner Whitcomb, whose birthplace was Littleton, Mass., had pushed north-westward about thirty miles into New Hampshire and become one of the founders of Hancock. There it was he had found and married Abigail, who was the daughter of Thomas Boynton.

The first settlement of the town was in 1764. Fifteen years after, on the 5th of November, 1779, the town was incorporated and then named after the patriot whose bold and handsome autograph upon the Declaration of Independence is familiar to every school-boy. The suggestion of the name doubtless arose also from the fact that Governor Hancock was a large proprietor of lands within the township. It

is a goodly town, full of hills and valleys and ponds and streams. Of the eight summits within its borders, Skatutakee, the highest, has an altitude of 2100 feet; and of its seven ponds, the largest, Norway Pond, round and shapely, is the jewel on its breast. Lying close by the village street, it is withal nature's skating rink for the youth of Hancock. The streams, numerous but small, diverge from the centre irregularly towards the circumference. Its principal stream, the Contoocook river, skirts its eastern border. On the near south-western horizon Monadnock looms up in solitary grandeur nearly 4000 feet high. The principal street, running east and west, hardly more than a furlong in length, broadens at the west end into a Common fronted by meeting-house, town-house and school-house; while the east end branches into three diverging roads.

On first coming to this town Abner Whitcomb had settled in a level place midway between Bald Hill and Norway Pond and a mile or so north of the latter. There he remained until the marriage of his son John, when the father gave up the homestead to the son and removed a mile eastward. But at the date of his marriage in 1806 he was living in a house built by him in his old age on Main Street. In this house, still standing, David Whitcomb was born on the 30th of May, 1808. His life in the parental household was of brief duration, and the after years of his childhood were cheerless and full of hardship. Put out at the age of seven to live in a family where unkind treatment was his lot, a chore-boy in another family at the age of nine, riding horse to plow, driving cows to pasture, tending a distillery, he found little time for schooling, and never had any from others worth speaking of. But in all his after life he was going to school to himself. Thus he became an apt scholar of a wise teacher; and though it could not be said that he grew wiser than his teacher, he certainly grew as wise. Meantime, his father, very old and wholly blind, died when he was twelve years of age. His mother, leaving him behind, went to reside with her brother, the landlord of the Lamb tavern in Boston; but in the end returned to Hancock and there died, leaving David alone in the world at the age of fifteen. He had never had a boyhood nor enjoyed the ameliorations of family life. Withal, as he approached his majority he came to have a sickly and somewhat consumptive habit of body. It was not strange that in later life the deep, almost preternatural furrows of his face told of that hard, harsh discipline of his early years.

At the age of eighteen he went forth into the world afoot to seek his fortune. A farm in the town of Gill, Mass., where now stands Moody's Mount Hermon School, was his first halting place. There he remained till September, 1829, when broken health drove him back to Hancock. He had now attained his majority and found himself in possession of about \$450, derived partly from his father's estate, partly

<sup>1</sup> By Chas. E. Stevens.

*David Whitcomb*

from his mother's, partly from an uncle's gift and partly from his own earnings. This little capital was David Whitcomb's nest-egg, and the chickens were not long in coming. A step was taken towards that result when with improved health he went to Templeton, Mass., to ask for the place of a pedler from his cousin, John Boynton, who was a tinsmith. But John Boynton was a cautious man and it had not yet been proved to him that David Whitcomb had enough capacity to be a tin pedler. Foiled for awhile in this forth-putting, he went back to Gill, staid a few weeks, then pushed on afoot to Northampton and ultimately to Ware. In Northampton he found a place with one Mrs. Mills to have the care of her horse and help in her kitchen at \$5 a month. In Ware he sought for work in the mills, but found it in the hotel of Deacon Porter in the guise of building fires, helping in the kitchen and blacking boots. No work, however menial, came amiss to this dead-in-earnest young man. At last John Boynton heard of his doings, heard that he was 'smart,' and in January, 1830, invited him back to Templeton. David Whitcomb lost no time. He went by stage to Petersham, thence on foot to Templeton and on the 18th of the same January made his first trip on wheels as a tin pedler. It was a trial trip, and a second followed; for John Boynton, cautious to the last, would not hire without a trial. David Whitcomb did not complain; it was in his nature to approve, rather. The trial was satisfactory, and an engagement for one year followed. For this service he was to have his board, \$100 and a "vest pattern." This was the turning point of his fortunes. It was a humble beginning of what was destined to have a noble ending. Planting his foot thus firmly on the lowest round of the ladder, he mounted rapidly, yet round by round, until he stood at the top. From the pedler's cart he went into the shop, then into partnership with his employer. The partnership was formed in 1831 with an equal amount of capital from each. In the next year a branch was established in Leominster of which as junior partner he was put in charge. Under his management the business of the branch soon surpassed that of the principal establishment in Templeton, and in two years he was recalled to become the practical head of the whole concern. Meantime, on going to Leominster he had taken to wife Margaret Cummings, a descendant of one of the early settlers of Hancock. The union proved a source of lifelong happiness to which three children contributed in full measure.

On becoming established in Templeton he largely extended the business and made it prosper beyond all its former record. The partnership with John Boynton continued for fifteen years in uninterrupted harmony; then, in 1846, was dissolved and Mr. Boynton retired from the business. A new partnership formed in 1848 with Col. Henry Smith, afterwards his son-in-law, was continued until 1853, when Mr. Whitcomb sold out the business to his partner

and brought this part of his life to an end. He had been in the tin business over twenty years. He had worked hard with hand and brain and had accumulated a handsome fortune measured by the standard of a New England country town. But he was still in the prime of life and had no thought of rest. Though never robust, work for him was always pleasure. His next move, therefore, was to the business centre of the county, where he established himself as a partner with C. Foster & Co. in the hardware business. His coming to Worcester was in the spring of 1854; the copartnership began in January, 1855, and terminated in January, 1866. It was for him a new business, but the business soon felt the hand of a new master. What he did not know about the details of the business he more than made up by his knowledge of business in general. Above all, he knew how and when and what to buy. The out-breaking of the Civil War gave him his opportunity. That calamity, which took the business life out of many, put new life into him. He was sure that the nation was not going to pieces; equally sure that because of the war early and large purchases would yield large profits. He bought Russian sheet-iron, stored it, then sold it at a large advance to the great New York iron firm of Phelps & Dodge. A frightened manufacturer offered him linseed oil below the market price; a single cask, or five at most, had been the usual purchase; but Mr. Whitcomb bought fifty casks at a stroke and then sold them at war prices and profits. In like manner a hardware manufacturer, closing up because of the war, offered him staple goods at prices below what had ever been known, and, inevitably, Mr. Whitcomb ordered the purchase of all that could be had. As box after box came in and was packed away in every available place, the conservative senior partner became dismayed, but was afterwards comforted when they were sold out at fourfold their cost. This generalship in business left an indelible impression on the juniors in the establishment who afterwards took the business when he laid it down.

Near the close of his connection with the concern he was taking initial steps towards the most important business venture in which it was his lot to be engaged. In 1864 his son, G. Henry Whitcomb, had been graduated from college and then taken into the hardware store with a view to learn the business. Finding his progress impeded, he threw up the situation and went forth like his father, though in more comfortable guise, to seek his fortune. Taking a journey through the West and scanning the chances in its chief cities, he quickly made up his mind that the place for him was in the East and returned to Worcester. Presently, a newly invented machine for making envelopes attracted his attention. It had a promising look and he laid the matter before his father. The latter listened, left him to work out his own schemes, but furnished the money for the ven-

ture. At the end of the first year the whole small capital had been sunk. This with many, perhaps with most, would have ended the matter. But a second lot of money was thrown after the first, and both were recovered. The scheme looked none the less promising because of the failure. For the failure was in the machine, not in the scheme; and never yet was there a work to do for doing which a machine could not be made if only it were worth the while. To manufacture envelopes by millions a day was surely worth the while. So, that bad first machine was thrown aside, the best machines in the market were bought and set to work, by successive inventions the Whitcomb machine was developed, and in due time, the Whitcomb Envelope Company took its place among the great industries of Worcester. By the end of the year 1866, David Whitcomb had gone out of the hardware business and thrown himself with all needed capital into this enterprise. It was not a new field with a virgin soil for a crop that would raise itself. On the contrary, it was an old worn field calling for deep digging and careful cultivation. There was the sharpest competition to be encountered. The veterans in the business derided these 'prentice hands. A thing so obviously necessary to the ongoing of the world as an envelope had not been left waiting for the Whitcombs to take hold of. What could they expect? So the old envelope-makers laughed at them. But the father's old head and the son's young enterprise proved more than their match. Wisdom, watchfulness, push and perseverance conquered; and in the end the Whitcomb Envelope Company, if not actually at the head of the business in the United States, was a formidable rival for that pre-eminence.

We have sketched the business life of David Whitcomb. A far more important part, both for himself and for his fellow men, remains to be considered. Had he done nothing and aimed at nothing but to achieve success in business he would have been a far richer man at his death but the world would have been far poorer. But when he began to be about thirty years of age, he met with that profound change which is most fitly described as a new birth. A new birth implies a new man, and such David Whitcomb became. In Leominster he and his young wife had made their church home with the Unitarians. On going to reside in Templeton they chose the Trinitarian church for such a home, although a Unitarian society, and a leading one, was there also. Soon afterwards, the Rev. Dr. Sabin became their pastor, and under his ministry, in 1839, they united with the church. The influence of this step at once became visible in the conduct of his life. He set up a family altar and there, morning and evening, maintained family worship. His workmen and pedlers, to the number of ten or more, were invited to share in this service. To all other christian duties he gave assiduous attention. Gradually, he came to be regarded

as not only a pillar, but as the chief pillar in the church of his choice. But the most striking change was in his use of the riches which he was so rapidly acquiring. By nature he was not a liberal giver. *Auri sacra fames* was with him a natural appetite. He loved money and loved to roll it as a sweet morsel under his tongue. This he freely confessed. But under the new inspiration he schooled himself to give. In this thing, also, he put off the old man and put on the new. Deliberately, systematically, persistently, he now made giving not only a business of principle, but a principal business. Beginning with the year following his new birth, he suffered no one of the forty-seven after years of his life to pass without making charitable gifts. In no year did the amount fall so low as \$100; in two years only was it less than \$200; for thirty-two it exceeded \$1000 a year; while in the last seven years of his life the average annual amount exceeded \$12,000. The whole amount of his known charitable gifts, testamentary and otherwise, exceeded \$350,000. No part of this great sum was given to get himself a name. No one knew of it all while he lived. He did not himself know; his right hand knew not what his left hand did. Several times he employed another hand to arrange and file the receipts covering a large part of this giving. When the work was done he was asked if he knew the amount and answered no. He was asked if he would like to know and gave the same reply. One time he gave some thousands to found scholarships in another person's name. He was asked if mention of it might be made in the papers and he answered no. The largest amount of all his giving, save in one particular, was to colleges and other institutions of learning. Because of his own lack in early life he cherished a tender feeling for the claims of young persons seeking an education. But he refrained from giving his money for structures of brick and stone. He had no ambition to build a monument of that sort to his own fame. The spiritual building made of lively stones spoken of by St. Peter was what he had most at heart. An endowment of scholarships that would help a long succession of poor boys and girls was the favorite form of his educational gifts. With one school of learning he had special and important relations. This was the Worcester County Free Institute of Industrial Science, now the Worcester Polytechnic Institute. His early friend and partner, John Boynton, had found it in his mind to bestow the bulk of his fortune for the education of the artisan class, the class to which he belonged. His first intention was to make the town of Mason N. H. his beneficiary. But under David Whitcomb's advice he changed his purpose in favor of Worcester. Having no formulated scheme of his own, he finally made over to Mr. Whitcomb by an absolute deed of gift the sum of \$100,000 to be used as the latter should think best for accomplishing the object. Mr. Whitcomb studied the situation, and

*Alex. H. Wilder*

then took counsel with his pastor, Dr. Sweetser, and with Gov. Emory Washburn the adviser of Ichabod Washburn who had a similar purpose in mind. At a later stage Stephen Salisbury came into the scheme, broadening and strengthening it with his sympathy, wisdom and money. The result, made operative in 1869, was the Free Institute. To David Whitcomb, therefore, the city of Worcester primarily owes that noble school of practical science. Nor was it only by diverting the first great monetary stream from a remote field to the "Heart of the Commonwealth," that he became its benefactor; out of his own resources he added to the treasury of the Institute more than \$27,000. As its treasurer and as trustee also, he watched over and guarded its interests for many years. This is not the place to enlarge upon this new departure in an educational scheme. It is sufficient to say that as it was the first of its kind, so, after full proof of its admirable working, it became the model for others in different parts of the country north and south.

In 1883 Mr. Whitcomb made a voyage to Europe for his health, and it was thought to have prolonged his life for some years. But his work was nearly done. He gradually set his house in order and prepared, as few men do, to take his leave of life. His death occurred on the 8th of July, 1887. The event called forth many warm tributes to his memory from persons of distinction, college professors, clergymen and others whose friendship he had long enjoyed. A sentence from the one by Senator Hoar may well conclude this sketch: "He was one of the best types of the New England character, faithful and true and strong and wise."

#### ALEXANDER HAMILTON WILDER.

Worcester County has had no more faithful public servant than Alexander H. Wilder, the long-time register of deeds, whose life-work began and ended in that office, covering a period of fifty-one years of continuous service, from 1823 to his death on the 12th of December, 1874. His portrait, which appears in this volume, was taken about ten years before his death.

He was born in Lancaster, Mass., July 20, 1804, and married, November 10, 1835, Harriet Eaton, of Philadelphia, whose mother was Eunice Wilder, another branch of the Wilder family, also of Lancaster, who married Nathaniel Eaton in 1792.

Alexander Hamilton Wilder was the direct descendant, in the seventh generation, of Thomas Wilder, one of the early settlers of Charlestown, Mass., who removed to Lancaster July 1, 1659. Nathaniel, the third son of Thomas, was killed by the Indians in July, 1704, and left four sons: Jonathan, also killed by the Indians in 1707; Nathaniel, of Petersham; Ephraim, of Lancaster, who was a member of the General Court for several years, and Colonel Oliver Wilder, a man of note in his day. Colonel Oliver had

four sons: Oliver, Tilley, Phineas and Moses, the eldest, Oliver, being the father of Samuel, whose son Calvin, born in 1773, married Susannah Solendine, also of Lancaster.

Alexander H. Wilder, the subject of this sketch, was the only son of this union, and came to Worcester in 1823, at the age of nineteen, and entered the registry office as a clerk under Artemas Ward, Esq., whom he succeeded as register in 1846. Mr. Wilder entered upon the duties of the office on the 17th day of June, 1846, and his name first appears in Book No. 409, and is signed for the last time in Book No. 945. Making due allowance for the greater length of modern instruments, it appears that fully one-half of the business of the office from the organization of the registry, in 1731, to the day of his death, in 1874, was performed under his administration.

The following brief extracts from the daily journals of the city, at the time of his death, attest the public esteem in which he was held.

[From the *Worcester Evening Gazette*, December 12, 1874.]

The intelligence of Mr. Wilder's death, which took place at 2 o'clock A.M., Saturday, will be received with surprise and deep regret by the community where he has for so many years quietly and faithfully performed his official duties as Register of Deeds for this county. Mr. Wilder, at the age of twenty, was seized with rheumatic fever, which left him a cripple for life, but for fifty-one years, as clerk or Register, he was always at his post of duty, except when some special illness detained him, and until a few years past the occasions of his absence were rare indeed. He was a man of deep religious feeling, and contributed according to his means to many religious and charitable enterprises. Besides the large circle, here in Worcester, who will miss him from his usual place, there is a goodly number of prominent men throughout the county—the men who bear the trusts of their fellow-citizens—who have for years visited his office at regular intervals, and in whose minds Mr. Wilder and Worcester were associated as inseparable—men whom he always welcomed with cheerful words, and who will feel that they have lost an old friend.

[From the *Worcester Spy*, December 14, 1874.]

The death of Mr. Alexander H. Wilder removes a public servant of uncommon modesty, faithfulness and industry. For more than fifty years he has been almost continually at his place in the office of the registry of deeds, and he has held the office of Register by successive elections ever since the year 1846. Of late years he has usually been the candidate of both parties, and elected, of course, without opposition. Probably no one who habitually transacts business with that office can remember the time when Mr. Wilder was not employed in it, and the experience of very few goes back to the time of the Register who preceded him. His unflinching courtesy and patience, his quiet and systematic business methods, his absolute rectitude and accuracy, made him a model official, whose service and example have been of inestimable value to the community.

Mr. Wilder was for many years a member of the Central Church, but transferred his allegiance to the Plymouth Church when that society was formed. His widow is still living at the age of eighty-eight, and his only son, Harvey B. Wilder, is the present Register of Deeds.

HARVEY BRADISH WILDER, son of Alexander H. and Harriet Wilder, was born in Worcester October 12, 1836. Besides the education acquired in the schools of the city, he also attended the Thetford Academy of Vermont, and the Leicester Academy in this county. He began the business of life in the Registry office, under his father's administration, in

1853. In April, 1855, he went to Boston and engaged in the book-store of Ticknor & Fields until August, 1856, when he returned to Worcester and became his father's chief clerk in the Registry office. With the exception of this absence, and the year 1876, when Mr. Charles A. Chase was elected Register of Deeds—to fill the unexpired term of Alexander H. Wilder, deceased—Mr. Wilder has been constantly connected with this office for over thirty-four years. He was elected Register to succeed Mr. Chase, and entered upon his duties January 1, 1877. The office ranks as third in the State in the number of instruments recorded—Middlesex and Suffolk preceding—notwithstanding the loss of five towns,—Fitchburg, Leominster, Lunenburg, Ashburnham and Westminster which were set off as a distinct registry district, and called the Worcester North District, by an act of the Legislature, in August, 1884.

The records cover a period of over one hundred and fifty years, and some idea of the volume of the work may be gathered from the fact that during the last twelve years there have been completed three hundred volumes of records, each of six hundred and fifty-two folio pages. The office has long been regarded as a model of systematic arrangement, orderly classification and accurate indexing.

Mr. Wilder has been a member of the Ancient and Honorable Artillery Company of Massachusetts since 1873, and has held rank as second lieutenant in that corps. He is a member of the Quinsigamond Lodge F. and A. M., and is widely known as a courteous official and a popular and companionable gentleman.

He married, October 21, 1862, Anna F. Chapman, of Ossipee, N. Y., who died November 12, 1864. For his second wife he married Mary J., daughter of Dr. Jefferson Pratt, of Hopkinton, Mass., June 14, 1870. They have one son, Charles Pratt Wilder, born April 3, 1873.

#### CHARLES FRANCIS WASHBURN.

The now extensive wire-drawing business of Worcester has an interesting history. It was commenced as far back as 1831, by Ichabod Washburn, who is yet remembered by many as a genial, benevolent and highly respected townsman. By his inventive genius, industry and enterprise he became one of the most wealthy people here, and was a man of marked Christian character and manly virtues; one who had deeply at heart, not only the material prosperity, but likewise the moral and intellectual advancement of his adopted home. He was from a good Old Colony family, a descendant of the seventh generation from that worthy Puritan, Governor Bradford. He came to Worcester in 1819, and here continued laboring for some time as a working blacksmith. He had a twin brother named Charles, who began his business-life as a practicing lawyer in Maine, but who left a fair practice and came to Worcester, where he joined Ichabod in his industrial vocation.

Charles F. Washburn, the subject of this sketch, was a son of Charles Washburn, just named, and, of course, a nephew of Ichabod. He was born in Harrison, Cumberland County, Me., on the 23d of August, 1827, and received a full high school education, but owing to ill health did not take a college course, as had been intended. He, however, in a most practical way supplemented his academic attainments by travel in Europe.

Mr. Washburn early exhibited a decided taste for mechanics, and his first efforts in a business way were as an operative in the works of his father and uncle here in Worcester. And connected with those works he has remained to the present time, rising from one position to another, and now finding himself one of the principals in a business of almost incredible proportions. The corporate firm-name is the Washburn and Moen Manufacturing Company. Mr. Washburn is vice-president and secretary; and the business is wire-drawing, rod-rolling, galvanizing and kindred work. Their wires for electric transmission, for telegraph and telephone purposes, have an especially high reputation. Their business is so extensive at the present time as to employ not less than three thousand workmen, and to turn out daily some two hundred and fifty tons, as mentioned in the sketch accompanying the portrait of Mr. Moen. In the chapter on Manufactures in preparation for the present work, by the competent hands of Charles G. Washburn, Esq., assistant secretary and counsel of the company, so full an account of this, in common with the other manufacturing establishments of Worcester, will no doubt be given as to render any further notice here unnecessary. And a general remark of similar nature may be made touching the sketches accompanying other portraits in the present work. These sketches are not designed to go much into detail regarding business relations, for matters of business are treated of in other connections; but are designed to be more directly of a personal character.

Mr. Washburn has not been conspicuous as a political partisan, but has served more or less in offices of a non-partisan character. He has been a member of the Common Council; is now president of the Home for Aged Women, a notably beneficent and successful institution; is a trustee of the Mechanics' Savings Bank, as well as of the Washburn Memorial Hospital, founded by his Uncle Ichabod, and much commended for its great usefulness and excellent management. In religious sentiment Mr. Washburn is an adherent of the Protestant Episcopal Church.

As a politician he ranked with the old Free Soil party, and when the great purpose of that party was accomplished, and its dissolution took place, he passed into the Republican party, whose principles he still maintains.

In September, 1855, he was united in marriage with Mary E. Whiton, and they have been the parents of eight children, seven sons and one daughter.

*Thomas M. Rogers*

Mr. Washburn is perhaps best known as a business man. As an officer of the great company with whose interests he had been so long and so intimately connected, he has fully appreciated his position. New lines of manufacture, akin to those primarily established, have received his patient investigation and, when found desirable, been adopted and developed. But their abundant means have never been wasted through heedless speculation or too sanguine expectation. To his exertions and judicious management it is reasonable to attribute a large share of the continued prosperity of the famed company with which he is connected.

---

THOMAS M. ROGERS.

Thomas Moore Rogers, the only son of Nathan and Mary C. Rogers, was born in Holden, May 10, 1818. He found himself in a large family of half-brothers and half-sisters, the father having seven children living and the mother four by former marriages. His mother died in 1828, and his father took for a third wife Sarah Blair, of Worcester, by whom he had three children. As one of this large family, it was a matter of course that young Rogers should, at a tender age, learn to know in what hard work consisted. And he was early taught the lesson of self-reliance, being entrusted, at the age of twelve years, with the duty of driving the team to market with timber, wood and other farm products, and buying stock and supplies for the house and farm.

At seventeen he "bought out his time" of his father for one hundred dollars, which he paid in cash at his majority, and found himself with a little balance over in the savings bank. His education had been by no means neglected; attendance at the district school, with two terms at the "select" or high school, and one at Westfield Academy, served as a training for intellectual faculties which were bright and active by nature.

Mr. Rogers came to Worcester in August, 1840, engaging as clerk with Blake & Trumbull, grocers, in Butman Block. In the spring of 1841 he formed the partnership of Smith & Rogers, for the manufacture of goat-skin shoes, at the north corner of Main and Mechanic Streets. Two months later the entire building was burned down with its contents. After settling all the debts of the firm Mr. Rogers was engaged to start a shoe-store at Oswego, N. Y. He returned to Worcester in January, 1842, and with George E. Chapin began the manufacture of boots over the store of Charles Boardman on Front Street. In April, 1844, he formed a partnership with John P. Southgate, for the sale of leather and "shoe-findings," on the present site of Piper's Block, removing to Paine's Block, at the corner of Pleasant Street, in 1850. Mr. Southgate retired from the firm in 1855. His place was soon taken by his son Reuben H., and Phillip Hunt being also taken as a partner, the firm was known as Rogers, Southgate & Co. In 1873 Mr.

Rogers sold out to his junior partners, who removed to Franklin Square. From 1873 to 1880 he was employed as assignee in the settlement of many bankrupt estates.

Mr. Rogers has been a large and successful dealer in real estate. His first venture was the purchase of an estate on Trumbull Street in 1847. This was followed by his buying a farm in Auburn, and next of a part of the Deacon Brooks farm at South Worcester, over which he constructed Canterbury and Southgate Streets. After several other purchases he bought of the Boston and Worcester Railroad Company an estate on Front Street, and built a block thereon, which he sold to George Crompton, with ten thousand feet of land running through to Mechanic Street. In 1866 he bought his old store at the corner of Main and Pleasant Streets, which he rebuilt in 1869. In 1867 he bought a large and sightly lot at the corner of Chatham and High Streets, on which he built a house to occupy as a homestead. In 1880, with Edwin Morse, he built the Odd Fellows' Hall building on Pleasant Street, and in 1883 built the block on the corner of Park Street and Salem Square, and bought a lot and stable on Market Street and other real estate in the city.

Mr. Rogers has always been interested in the welfare of his adopted town and city. He was a member of the Common Council in 1876-77 and of the Board of Aldermen in 1886-87. He served as trustee and a member of the investing board of the Worcester County Institution for Savings, and now holds the same offices in the People's Savings Bank, of which he is also one of the vice-presidents. He was for several years a director of the Citizens' and of the City Bank; is director of the Street Railroad Company and president of the Worcester Electric Light Company. He married, in April, 1843, Mary S., daughter of Israel and Charlotte Rice, of Shrewsbury. The result of this union was two children,—Ellen Frances and Walter Thomas,—of whom the former survives. Mr. Rogers is of the "Orthodox" faith of New England, belonging to the liberal wing of the denomination. In politics he is a Republican, but he believes that all good citizens should have a representation, especially in city affairs.

---

ALBERT CURTIS.

Mr. Curtis is prominent among the sons of Worcester who have been highly prosperous and who have made for themselves names that will always figure conspicuously in the history of her industries. He was born here on the 13th of July, 1807, and is consequently now to be numbered among her most aged, as he has long been numbered among her most useful and reputable citizens. He was one of a large family of children, and was bereaved of his father at so early an age that he could hardly have realized his loss.

Even before he had completed his first decade of years Mr. Curtis was, to a considerable extent, compelled to provide his own living. After remaining for a time with an uncle in Auburn, and afterwards with an elder brother in Tioga County, N. Y., doing what he was able to at farm labor, he returned, at the age of seventeen, to Worcester, robust in health and with a laudable ambition to so far better his condition as to be dependent on no one for support. His education up to this time was such as he had been able to acquire in the winter district schools, which, at that time, had not arrived at the degree of excellence they have now reached.

His first engagement after returning to the place of his birth was in the service of White & Boyden, who were manufacturers of woolen machinery. In their employ, as apprentice and journeyman, with a brief interval or two, he remained several years. In 1831, with John Simmons and Abel Kimball as partners, he commenced a business of his own, in the manufacture of machinery suitable for use in various departments of cloth-making. His business, from time to time, so broadened that in a few years he found himself not only in the manufacture of cloth machinery, but of cloth itself. He was presently the owner of extensive mill property, at times turning out large quantities of cotton sheeting, satinetts and woolen goods of various descriptions. His early knowledge of machinery stood him in good stead in the various branches of his extensive business, and aided greatly in his accumulation of wealth. During his business career, too, he has formed one or two partnership connections that have been of great assistance, both by their added knowledge and experience and by sharing in the labors and anxieties incidental to so large and constantly increasing business relations.

Twice during his business career he has suffered largely by destructive fires; but, nothing daunted by such vicissitudes, immediately set about repairing and rebuilding.

Having in his early years imbibed a taste for reading, he acquired a good knowledge of books, and that, in its turn, begat a desire to pursue studies in various departments of intellectual culture; particularly has he been interested in historical and antiquarian researches; has been a vice-president of the Worcester Society of Antiquity and an efficient member of some other like associations.

For the last thirty years Mr. Curtis has been the owner of many acres of farm land, and taken unbounded delight in the cultivation of choice products. But as to whether, on the whole, he has taken most pleasure in the "rural sounds" of the farmstead or in the hum of factory machinery, the writer shall not venture to make a guess. He himself would very likely declare that both were, in their way, "music to his ears."

Like most individuals whose lives are devoted

largely to their own concerns, he has spared comparatively little time to public affairs, never seeking office, though not really shunning a public position when it appeared that a valuable end might be promoted. Before the adoption of the City Charter, as early as 1840, he was chosen a selectman of the town and served two years. He was a member of the Common Council the first year of the infant city, and an alderman in 1857.

In politics Mr. Curtis has been an unswerving adherent of the Republican party, having passed into it from its father, the Whig party, and from its grandfather, the old National Republican party, and, may it not be added, its great-grandfather, the Federal. In his religious views he adheres to the Trinitarian Congregational faith, as his fathers did, and became a church member as early as 1828.

The first wife of Mr. Curtis was Mrs. Griffin, of Sterling, the marriage taking place in October, 1833. His second wife was Mrs. Bancroft, widow of Rev. David Bancroft, to whom he was married in 1880.

A Curtis genealogy has been prepared with much labor and care, which gives a good many family tracings and matter of enduring interest, especially to the family connections.

It will be observed that Mr. Curtis has already passed the boundary of four-score years. And were it allowable in a work like this, a good opportunity would be afforded for indulgence in a sentimental strain. What can be more grateful to the octogenarian than to look back upon a well-spent life—to trace, in the serenity of his old age, the progress through the volatile days of childhood, the hopeful years of youth and the ambitious period of manhood—to recall the faces of loved ones, and again live over the pleasant scenes that have been as sunbeams on the path. None of us, however, can indulge in a lifetime retrospect, and not fall here and there upon a gloaming passage. But it is not wise to sigh over what admits of no change; wiser it is to linger on the brighter side. But the octogenarian who has no well-spent life to view in retrospect—what of him?

#### MARTIN V. B. JEFFERSON.

Martin V. B. Jefferson, of Worcester, was born in Uxbridge, Mass., May 19, 1833. His grandfather was a soldier in the Revolution, and also in the War of 1812. His father died when he was but eight years of age, and Martin was "put out to live" with an uncle in Holden, Mass., on a farm, where he received ten weeks' district schooling and his board and clothes as compensation for his labor. At the age of sixteen his natural independence asserted itself, and he went back to Uxbridge and learned the trade of shoemaking, having acquired which, he earned sufficient money by working mornings, evenings and during school vacations to pay his expenses at Uxbridge Academy, which he attended for four years. In 1853

*W. V. C. Johnson*

he went to work on the Providence and Worcester Railroad as brakeman and baggage-master, but, having an arm and leg broken by a railroad accident, he was obliged to suspend work. On his recovery, in 1854, he went to California, where he remained six years. The first year he kept a restaurant at San Jose, the second year he sold fruit-trees at Sonora, but the remainder of his stay in California was devoted to selling milk from a large ranche where he kept from eighty to one hundred cows.

Having acquired a considerable sum of money, Mr. Jefferson returned to Holden in 1860, where he married a daughter of Deacon William Howe, of the firm of Hall & Howe, who were then running a small, one-set woolen-mill in Drydenville (now Jeffersonville), a village in the town of Holden. In November, 1860, he purchased Mr. Hall's interest in the mill, and for twenty-six years he was in partnership with his father-in-law in that business under the firm-name of Howe & Jefferson. Meanwhile the little one-set mill has been enlarged six-fold, and a second mill, with six sets of machinery, has been added, making a total of thirteen sets, the two establishments employing two hundred and fifty hands. The little village has grown to eight times its former size, and now supports two railroad stations on the Fitchburg and Central Massachusetts Railroads and a post-office.

Mr. Jefferson's business capacity, shrewdness and integrity have secured for him a merited success in business and the confidence and esteem of a large circle of acquaintances.

For ten years he served as selectman of Holden, a portion of the time chairman. He was a director of the Boston, Barre and Gardner Railroad for several years, is a director of the Cotton and Woolen Manufacturers' Mutual Insurance Company, and also of the Quinsigamond National Bank of Worcester. In 1875 he removed his residence to Worcester for the sake of better educational advantages for his daughter. He was elected to the State House of Representatives in 1880 from the Nineteenth Worcester District by a handsome majority, and was returned in 1881. In politics he has been a staunch Republican since he cast his first vote for John C. Fremont for President in 1856. He is accustomed to congratulate himself that he has always paid one hundred cents on the dollar, a phrase which fully expresses the general estimation in which Mr. Jefferson is held socially and politically, as it does his financial and business standing. He brought to his legislative duties the same stirring qualities he has displayed in other things, and served on the important Committee on the Hoosac Tunnel, Troy and Greenfield Railroad. Mr. Jefferson was elected to the State Senate from the First Worcester District, which comprised the city of Worcester, in 1884 and 1885, and served on the Committees on Railroads, Treasury and Labor. In 1888 he was chosen as alternate delegate to the Republican National Convention from the Tenth

Congressional District. In 1880 Mr. Jefferson bought his partner's interest in the business, and now runs the mills himself, by the name of the Jefferson Manufacturing Company, making woolen goods.

#### LUCIUS J. KNOWLES.

Mr. Knowles was born in Hardwick, Worcester County, on the 2d of July, 1819, and was educated in the common school with a three years' course in the well-known Leicester Academy. He early manifested an inclination for mechanics and exhibited rare inventive genius; his boyish contrivances eliciting much attention and many predictions as to future achievements.

He left home at the age of seventeen and went to Shrewsbury as assistant in a store, where, in about two years, he rose to the position of partner. But his penchant for mechanics made him so restless as to induce him to quit that employment, though all along he had found opportunity to indulge his inclination to some extent, and among other things had contrived certain improvements in reed-organs and other instruments and completed models for one or two improved appliances for steam-machinery, especially that known as the Knowles Safety Steam Boiler Feed Regulator.

He gave up his store business in 1840 and began to study into the feasibility of the application of electricity as a motive-power. Then he applied himself to gaining a knowledge of photography, at that time a newly-discovered process. For a while on from 1844, having invented a spooling-machine, he was in the manufacture of thread at New Worcester. Soon after that he commenced the manufacture of cotton-warp; and in 1853 he began the manufacture of woolen fabrics. His mind seems to have been almost unremittingly employed in devising some beneficial mechanical contrivance; so that during his life, it is asserted, he obtained at least a hundred patents for useful inventions chiefly connected with manufacturing machinery.

It was in 1866 that he came to Worcester and with his younger brother, Francis B. Knowles, whose portrait, with a biographical sketch, appears in the present work, began the manufacture of looms. The business rapidly increased and is now one of the leading industries of the place. The looms, of which it is said a greater variety are made than in any other place in the world, were invented by the partners and are fitted for the manufacture of a great variety of fabrics, from heavy woolen carpets to delicate silk ribbons.

Mr. Knowles was somewhat in public life—was a legislative Representative in 1862 and 1863, was a member of the State Senate in 1869; in 1873 was a member of the Common Council of Worcester; was a director in the Central National Bank; a director in the State Mutual Life Assurance Company; president

of the People's Savings Bank, and president of the Worcester Board of Trade. And various other institutions of a financial and semi-public character have had the benefit of his efficient services.

The honorary degree of Master of Arts was conferred on him by Williams College in 1869.

Mr. Knowles' death took place in Washington, D. C., February 25, 1884, and was very sudden, occasioned by neuralgia of the heart.

For his mechanical genius and skill Mr. Knowles had a high reputation—a reputation that extended far beyond the limits of our own country; and his inventions have in many ways, and to an untold extent, added directly and indirectly to the comforts and conveniences of the world at large, but his reputation for true manhood, for liberality in the support of charitable and reformatory enterprises, for sympathy with the suffering and relief of the indigent, was almost as extensive, and far more to be envied. His business connection with his brother Francis was characterized throughout not only by the most friendly of trade relations, but by true brotherly complaisance. And so intimately connected were the two in some of their inventions and improvements that it was hard to determine to which the highest honor was due, each being ever willing to accord to the other the greater share of merit.

It is often said that distinguished inventors usually live and die poor; at least such of them as are dependent upon their own exertions for a livelihood, and that others, with more selfishness and worldly shrewdness, reap the benefit of the inventions; in other words, that the inventors beat the bush and the others catch the bird. It is undoubtedly true that the inventor is usually more absorbed in perfecting his invention than in calculations as to the benefit that may accrue to himself—so absorbed as to let slip the best opportunities for self-enrichment. It is also undoubtedly true that some inventors are moved by the lofty purpose of benefiting the world in general, disregarding, or even sacrificing self-interest. But there are others, both broadly benevolent and worldly wise, who maintain a well-balanced purpose of benefiting the community and at the same time advancing their own interest, and in looking at the result of the labors of Mr. Knowles it seems fair to conclude that he belonged to the latter class, for we find that he rose from comparative indigence to affluence, and at the same time so used and so disposed of his inventions as to greatly benefit others, not to mention that all along, with judicious liberality, he dispensed of his gains in ways most helpful to those about him.

#### FRANCIS BANGS KNOWLES.

Mr. Knowles is a native of Hardwick, in Worcester County, and was born on the 29th of November, 1823. His early education was sufficient to enable him, at the age of seventeen, to take charge of a district school.

And in the capacity of a teacher he spent a few years, though the profession was not exactly suited to his taste and was pursued with the design of being relinquished as soon as something more congenial presented itself. He well knew that his success in life depended on his own exertions, and that something of broader scope must engage his attention if financial accumulation were to become a leading object. Yet such an object appears never to have actuated him in the light of an end, but as a means. And it is seen by his after-life, when affluence had been attained, that he did not view wealth as an end to enable him to indulge in luxury and barren ease, but as a means by which he could benefit his generation and do something for the good of the world at large. And he was soon pointed to as one who fully recognized the higher duties of life, the paramount requirements of religion, benevolence and good citizenship. It is the example of such an one that stands as a constant admonisher of the drowsy idler, the indifferent and irreverent. It is an example, too, that by its mute warnings and refreshing sympathies is so attractive.

Thus, Mr. Knowles is found a constant and liberal contributor to the churches of the faith in which he was bred and to which he has adhered. To the Plymouth, the Piedmont Congregational and the Pilgrim Congregational, of Worcester, he has been especially helpful. But other religious societies and charitable institutions of various names and pursuing different ways of benevolence have shared in his bounty and received fresh courage through his wise suggestions and unstinted liberality.

Something, however, should be said of Mr. Knowles' business enterprises, through which he has been enabled to gratify to such a degree his generous inclinations. Like many another thrifty New Englander, he seemed, during his years of early manhood, to be searching for his true position—the position he was best fitted to occupy, and which would most surely "lead on to fortune." This is a trait that conspicuously distinguishes the American from the European, inasmuch as the latter seems to feel that the condition in which he was born is that in which he must die; having little conception of the advanced position an aspiring and energetic man might attain. Was it not Milton who wrote that Providence designed a niche for every one—a niche which would, if occupied, ensure the greatest usefulness and the happiest end? If that is so, it would seem, in looking over the community, as if many of us had somehow got into the wrong niches. But be that as it may.

After engaging in several manufacturing enterprises, in a subordinate capacity, Mr. Knowles appears, in 1845, in the first established business of which he was head and director. This was successful. It was the manufacture of buckskin gloves and mittens, and in due time developed into that of general furnishing and the sale of gentlemen's clothing. This was profitably produced for several years, when

*James H. Wall.*

his elder brother, Lucius J. (since deceased, but at that time a steam-pump maker in Warren), offered a more desirable situation. A partnership was soon formed. The business was removed to Worcester in 1866, and the manufacture of looms on an enlarged scale commenced, a little in the same line having been done in Warren.

Lucius J., the brother, died in 1884, and since that time Francis B., the subject of this sketch, has been the chief director in the business, which has now attained to such magnitude as to rank among the very first of the industries of Worcester. A company was formed under the name of "Knowles' Loom Works," with Mr. Knowles as president, and has already secured a reputation eclipsed by none. The works are thus spoken of in that handsome and valuable volume recently published, entitled, "Worcester: Its Past and Present:"—"The Knowles Loom Works is one of the largest industries of Worcester. . . . The main building is five hundred feet long and three stories high, with an 'L' one hundred feet long. The looms are inventions of the proprietors, and include those adapted to the manufacture of carpets, velvets, plushes, silk and worsted dress-goods, fancy worsteds, cassimeres, fancy cottons, gingham, tapes, fine hose, suspenders, silk ribbons and others. It is said that a greater variety of looms are made in this establishment than in any other the world over. Six hundred skillful workmen are here employed, and invention is ever busy with new time and labor-saving appliances to increase the capacity of the loom or add to the perfection of the fabric, so that new looms are now complete and more economical than old ones. The volume of their business is constantly increasing. These looms are also built abroad on royalty."

Several of the last winters have been spent by Mr. Knowles in Florida, in which State he now owns extensive tracts. He has orange groves—the pride of that sunny land—and large interest in hotel property, which yields not only a fair income to himself, but affords delightful temporary homes for winter sojourners from the bleak North. But above these temporal matters is the interest he takes in the educational and moral advancement of the people of his Southern home,—an interest especially obvious in his liberality to Rollins College at Winter Park, on which he has bestowed Knowles Hall and a fund for the maintenance of a scholarship for indigent students.

In politics Mr. Knowles has constantly adhered to the principles of the Republican party, and been liberal in his contributions for party ends, though never seeking or desiring official position.

As before intimated, he has been active in religious duties; has adhered to the old Trinitarian Congregational faith; was especially assiduous in the foundation of the Pilgrim, the Plymouth and the Piedmont Churches, and has held the office of deacon in the latter ever since its foundation. Sunday-school

work has especially engaged his attention for many years.

Mr. Knowles has been twice married. His first wife was Ann Eliza Poole, of Gloverville, N. Y., and by her he had one daughter and one son. His second wife was Hester A. Greene, a daughter of John R. Greene, of Worcester, the union taking place April 23, 1867, and by her he has had two daughters and one son.

#### JAMES H. WALL.

James H. Wall was born in Greenville, Leicester, November 28, 1810, son of Caleb and Sarah (Farnum) Wall. His father was a blacksmith, scythe manufacturer and miller in Greenville from 1799 to 1833, and son of Thomas and Patience (Arnold) Wall, of Smithfield, R. I. The mother of James H. was a daughter of Moses Farnum, a noted minister of the Society of Friends in Uxbridge, by his second wife, Elizabeth Southwick, of that town. The latter was a direct descendant in the fifth generation from Lawrence and Cassandra Southwick, who were among those driven from Massachusetts by the persecuting Puritans two hundred and thirty years ago for being Quakers. After attending the public schools, which was only about eight weeks in the year, in his native village, and the usual accompanying labors on his father's farm, till he was in his eighteenth year, Mr. Wall, in the spring of 1828, went to learn the shoemaker's trade with the late Jeremiah Bond, in Paxton. In June, 1831, he started business in a small way for himself, doing custom-work in Clappville, now Rochdale. Here he remained till February 19, 1837, when he removed to Worcester,—then a town of seven thousand inhabitants,—and entered the shoe and leather store of the late Benjamin B. Otis, in what was known as Goddard's Row, first as workman and then as salesman and clerk. In the fall of that year he opened a shoe and shoe-findings store in an old wooden building which stood on the site of Grout's Block on Main Street, between Mechanic and Foster Streets. The following spring of 1838 he entered into partnership, in the same business, with the late John P. Southgate, in the old Denny house, which stood on the corner of Main and Mechanic Streets. In the spring of 1840 he sold out his interest to his partner, Mr. Southgate, and opened a boot, shoe, trunk and findings store in a building which stood where the Worcester Mutual Fire Insurance Block is. In 1842 he sold out to C. C. Clapp and S. P. Fitch, who continued there, and Mr. Wall opened a boot and shoe store in Brinley Block, where he was in partnership with the late Edward Southwick for a short time. In 1843 he entered into the real estate business, and December 14th of that year bought, with Edward H. Hemenway and Samuel D. Harding, the old Worcester House estate, comprising thirty-three thousand five hundred and forty-eight square feet of land, on the corner of Main,

Elm and Maple Streets, for fourteen thousand dollars, by the subsequent management and sale of which he realized a handsome sum as his portion of the profits, from the advanced value. In other real estate operations he realized similar proportionate profits by his skillful buying and selling at the right time, from rise in values. He has probably owned a longer frontage on Main Street, in the southerly section of the city, than any other one person, except when the land was owned and occupied for farming purposes. At various times he has been the owner of nearly fifty acres of land, then vacant, now nearly all built over.

Among the buildings he erected was Lincoln House Block, on the front portion of the old Worcester House estate, and the block of three dwelling-houses on the rear, now owned and occupied by Charles S. Turner, H. H. Bigelow and William H. Morse. Also, he built in 1848 a dwelling-house for his own occupancy on the corner of Main and Benefit Streets, in which he resided till the fall of 1863, and then sold it to George W. Gill, and it is now owned and occupied by the Children's Friend Society, known as the "Orphans' Home."

After forty years' residence in Worcester Mr. Wall in 1877 removed to Boston, where he has since lived, but he has never given up his connection with the First Baptist Church in Worcester, of which he and his wife have been members for nearly fifty years, and he has never relinquished the idea of making Worcester his last dwelling-place, it being the theatre of most of his active business life; and he now considers Worcester his real home and Boston but a temporary one. He has never lost his interest in and love for Worcester, among the renewed evidences of which being his recent purchase of the valuable estate called Paine Block. In Boston he has occupied himself in real estate operations in which he has met with success.

In politics he was a Jackson Democrat on general principles and gave his first vote for Andrew Jackson for President in 1832; but he has since acted with other parties, when, at times, the issues were more in accordance with his views. He was one of the original Anti-Slavery and Liberty party men, and one of the original "Free Soilers" in 1848; secretary of the first Free Soil County Committee, and an active worker in that cause from the beginning of the movement. Many of the impromptu "Free-Soil" meetings on the Common, in the campaign of 1848, were got up by him, and addressed by speakers from the east portico of the City Hall.

On the evening of May 18, 1887, he gave a complimentary banquet at the Lincoln House to his brother, Caleb A. Wall, the veteran journalist of the Worcester *Spy*, in celebration of the fiftieth anniversary of his brother's connection with the Worcester County press. This was a meeting of about one hundred and fifty of the oldest and most honored citizens of

Worcester, described in the newspapers at the time as "one of the most remarkable gatherings ever held here; representing those longest and most closely identified with the varied interests of the city, including men from all walks of life, from the pulpit, the legal and medical professions, the National and State Councils, business, trade and the shops, comprising an array of veterans in experience and the venerable in years never before seen together here."

The following poem, written by Mr. John Howard Jewett, of the *Evening Gazette*, was read on the occasion above referred to:

1837-1887.

#### DEDICATED TO THE SEMI-CENTENNIAL BANQUET

IN HONOR OF

MR. CALEB A. WALL.

#### CONFIDENTIAL.

A poem was wanted this banquet to grace;  
Most diligent search revealed not a trace  
Of Poet in Worcester, hence, this lesser plan—  
To farm out the job to a newspaper man.  
The dailies and weeklies were ready betimes,  
With scribblers galore, all chock full of rhymes,  
To suit this occasion, and thus it befel  
They all got to wrangling about who should tell  
This story to-night, and to save discontent  
At last 'twas decided to flip up a cent.  
Up went the copper—to the writer's surprise  
The lot fell to him—the *Gazette* won the prize.

And this is the story—a legend in rhyme—  
Though Pegasus falters, the theme is sublime,  
Unfolding a record that's writ on Time's Scroll,  
Indelible there, while the centuries roll.

#### THE LEGEND.

Old Time, with his hour-glass, while counting the years  
Of life, with its record of hopes and of fears,  
Its joys and its sorrows, successes, defeats,  
—The ceaseless old story which History repeats,—  
Aweary had grown of his task, and to find  
A trusty and capable "sub" to his mind,  
Dropped in on the *Spy*, in its Argus-eyed den,  
And found our friend Caleb still wielding his pen.  
"Ah! Caleb, old fellow, a grip of the hand,  
Delighted to see you!—The gods must have planned  
This fortunate meeting, for me, I'll be blest,  
I want a vacation; come, give me a rest,  
You tireless mortal, just fill in the gap  
For a decade or two, whilst I take a nap.  
The man of all men, at last I have found;  
They'll never suspect that I'm not around,  
As usual, Caleb, for you've got the grip  
On all that I know, and can give 'em the 'tip.'  
Long practice has made you expert with the score  
Of life's shifting games;—a few innings more  
Will win you the title of Time's Referee,  
The Champion Recorder, Historian *per se*;  
So turn my old hour-glass, your annals complete,  
I'll snooze!—and George Bancroft can take a back seat."

Now all the old fellows who know Caleb Wall,  
Must know that he never has shirked duty's call.  
A kindly eye beams 'neath his gray, grisly locks,  
His heart, well, his heart is as big as an ox.  
Of course he said "Yes," in his good-natured way,  
And took up Time's burden as if it were play.  
Time loafed. Caleb toiled in his stead,—he toils yet,

To put upon record what others forget;  
To keep the old memories, old places, old names,  
Still bright on Time's pages; to score up the games  
Dead yesterday saw, side by side, in array  
With those Worcester plays on the field of To-day.

How faithful his service, all know who can read  
Where he winnowed the chaff, preserving the seed.  
With much that's undying his name will be blent,  
For he's used every talent that nature has lent,  
To rescue and save from oblivion's clutch,  
Restore to the living, by magical touch  
Of his painstaking pen, the treasures of old,  
Safe garnered, for others to have and to hold.  
Nor solely for bread hath he wrought long and well  
For full fifty years, for love's charmed spell  
Hath hallowed his task, and crowned his ripe age  
With good friends, a good name; earth's best heritage.

Then, Hip, Hip, Hurrah! no trouble we'll fear,  
We'll toast him to-night. He'll embalm us, 'tis clear,  
In History's pages, and hand our names down  
To far distant ages. Posterity's crown  
He will win, in a night, for us one and all  
—The friends and well-wishers of Caleb A. Wall!

#### INCIDENTAL.

Hush! A word for our host, who gathered us here  
To honor his brother, and share his good cheer.  
We know him of old, as a man among men,  
Not one of our craft,—but who writes with a pen  
His name in a check-book, on bond, or on deed,  
[His autograph pays for this bountiful "feed,"]  
That's honored for all which the paper implies;  
Whose word is as good as his bond, till he dies;  
Whose history, if written for three-score and ten,  
Would need a whole volume, and worthier pen.  
Yet, to point out the moral adorning this tale,  
How honesty, thrift, and good sense will prevail,  
And yield a rich harvest, this fact we'll relate:  
Our host here was born to an indigent state,  
But made his own fortune, nor wronged any man,  
Never hankered for office. Instead, 'twas his plan  
Of life to keep every promise and word;  
To mind his own business:—And who ever heard  
Of his failing to do so? That's James H. Wall!  
As every one know him, who knows him at all.

Long life to the veteran whose busy career  
Has crowned him successful; whose life has no fear  
Of want, or dishonor; no secrets to hide,  
As he waits on the shore to go out with the tide.

Then echo, ye walls, to the Walls ye surround!  
"May brotherly love and good cheer still abound;"  
Once more then, Hip! Hip! Let us fill to the toast  
"To Caleb and James—Historian and Host!"

#### WHAT CALEB REMEMBERS.

What Caleb remembers? From the feast of the years,  
Some scraps have been saved, for use it appears  
At banquets like this. Let us nibble a bit  
On well-seasoned chestnuts,—though scanty of wit,—  
They may yield some food for reflection, or move  
To smiles, and thus moral digestion improve.

What Caleb remembers, would make quite a store  
Of family recipes; guides to explore  
The art of right living; a digest of Time  
For statesmen to chew on, for scribblers to rhyme  
And wring nutrition:—in a word we might say  
The Yesterday's viands warmed up for to-day.

Our Caleb remembers, in life's early morn,  
Our modern improvements were mostly unborn.  
In stages, the wealthy, through pasture and wood  
Went shopping to Boston; if walking was good

The poor went on foot. How blankly they'd stare  
At our express trains and our one dollar fare.  
Or Raymond's Excursions, North, South, East, or West,  
With Drawing-room, Sleeper, Buffet and the rest!

Our Caleb remembers the Pony Express  
Was lightning despatch, in haste or distress,  
Ere Telegraph Cables encircled the globe.  
The Telephone!—torture unknown to old Job  
Or else he'd have weakened, his patience worn out  
While pretty girls flirted and left him to shout,—  
All these comforts and trials, this worry and haste,  
Are ours, who have life, but no minutes to waste.

Our Caleb remembers, when he learned his trade,  
Hand presses were modern, the fastest then made;  
Five hundred an hour, and one side at a time;  
Despatches by post from a far away clime  
Meant Albany then while the news from Bombay,  
Instead of ten minutes, ten months on the way!  
Their weekly editions for a year, by hand-power,  
Could be printed to-day in less than an hour  
On presses that run the big dailies we read.  
Ah! how we've outstrip'd those old fogies—in speed.

Our Caleb remembers, finance in those days  
Was saving and safety, and old-fashioned ways  
Of honesty, thrift, and to keep best your own;  
Not promising bread, to repay with a stone;  
Not haste to get riches, to pamper false pride;  
But work, slow and sure, earn and save till you died.  
Stock gambling and Futures, and Corners in food,  
Reward would have found in Stocks made of wood;  
The popular route wasn't Canada then,  
Nor were places of trust filled by travelling men.

Our Caleb remembers, in matters of State  
The people concerned were allowed to debate;  
To choose from their number the fittest, to send  
Their cause to uphold, their rights to defend.  
Sound statesmanship, genius and brains, then controlled  
The honors, Bonanza kings buy with their gold.  
The lobby existed, no doubt in those days,  
And worked for its schemes in legitimate ways,  
For Beverly boodle,—to bring the point home—  
And cheek to apply it, the day hadn't come!  
Men strove with great questions, had courage to face  
Unpopular issues, nor held it disgrace  
To stand and be counted for Right every time.  
'Gainst mob or the "party's" political stime.

Our Caleb remembers when National tasks  
Were borne on the shoulders of men without masks;  
No coddling, or truckling to socialist mob;  
No premature pensions, put up for a job;  
No surplus, maintained by duties imposed  
For needless protection, and avenues closed  
To fair competition, in cost to produce  
Nine-tenths of our needs for consumption and use;  
No, cry, universal, for some simpler plan  
To protect fellow-man from laws made by man.  
"Utopian?" Possibly! Mere waste of breath,  
When statesmen (alleged) legislate us to death!

Our Caleb remembers,—say! perchance we're rash  
To serve you so much of this dubious hash.  
We'll therefore, omit all such intricate woes  
As Interstate Commerce, which nobody knows;  
Reformed Civil Service, which both parties claim;  
The Coinage of Silver, nobody to blame;  
The Mormons in Utah; the poor Indian "Lo;"  
The old bloody shirt, washed in tears long ago;  
And divers grave questions the papers discuss,  
To make more a muddle, and muddle the muss.  
The shield has two sides, we'll gladly admit,  
—The bird flutters most, however, that's hit;—  
And, if it will soothe any wounded bird here,  
We'll own that the prospect improves with each year.

The reason is plain, manifest beyond doubt,  
The people are finding the bl—k rascals out !  
Just wait a few years until that party wins  
Which means to Reform, —to reform its own sins !

Our Caleb remembers,—and so does the scribe,—  
That life is misspent which is all diatribe,  
And therefore craves pardon, and begs to remind  
The growlers in this world, a better to find !  
For all who will read Caleb's volume aright  
Will find that it pays to "keep honor bright."  
Don't crowd, fellow-mourners ; Be true ; Be a man ;  
Press forward ; Look backward ; Improve on the plan !  
This, then, is the nub we've been trying to borrow :  
Let yesterday's serve for to-day and to-morrow !  
For brotherly greetings, and this friendly call,  
Our Caleb will kindly remember you all.

September 13, 1831, Mr. Wall was united in marriage with Mary Ann, oldest daughter of Benjamin R. and Elizabeth (Davenport) Davis, and she is still living. From this union there were born seven children, four of whom are now living. Two, Mary Ann and Thomas A., died in infancy, and Joseph S. died in 1864, aged nineteen. The oldest, George F., is married, residing in Worcester ; Sarah Elizabeth married Sumner W. Balcom, residing in Boston ; James H., Jr., is married, residing in Chicago ; and Emma Isabella married Charles S. Connell, residing in New York City.

Among the civil positions which Mr. Wall held during his forty years' residence in Worcester, he was three years in each branch of the City Council ; Common Councilman in 1852, '53 and '58 ; alderman in 1854, '55 and '56 ; two years assessor, in 1849 and '59 ; and he was highway surveyor for the Centre District the last year of the town, 1847-48.

Mr. Wall has always been considered by those who best knew him, and are best qualified to judge, as a careful and conservative man in all his business transactions. He has frequently been called upon as an expert in the values of real estate, by city, corporate and private parties.

#### EDWARD AUGUSTUS GOODNOW.<sup>1</sup>

Banking and Beneficence are the two words which mark the claim of Edward A. Goodnow to the regard of his fellow-men. As a banker he enjoys the reputation of being one of the most eminently successful in New England ; as a giver of large gifts for educational uses his name is a familiar word in schools and colleges at the east and west and south and beyond the sea. Having a talent for making money and a disposition to give it away, he has scattered his heap as fast as it has accumulated and thus refrained from becoming, what he might easily have become, a millionaire. And having no children of his own he has used his wealth for the education of the children of his fellow-men.

Mr. Goodnow was born in the town of Princeton on the 16th of July 1810. Princeton is one of the

noteworthy towns of Massachusetts. Within its borders rises Wachusett mountain, the most elevated, save one, in the commonwealth. From its summit may be seen in the far distance the golden dome of the State House and the Atlantic ocean, while in the near distance almost numberless white villages and shining little lakes nestling among low hills captivate the eye, with the populous city of Worcester twelve miles away emphasizing the landscape. Princeton village and farms, clustering around the foot of the mountain, are perhaps at a higher elevation than any other inhabited spot in the state. Because of these natural advantages—the sightly mountain, the salubrious atmosphere, and the nearness to the great cities—Princeton more than fifty years ago began to be a favorite place for summer resort, and with each returning year has been growing in public favor.

To this town, sometime in the last century came Edward Goodnow from Sudbury, on his way sojourning in Northborough long enough to find and espouse a wife. Born to them was another Edward, who in turn became the father of Edward Augustus the subject of this sketch. He was consequently the third Edward in succession and in the third generation from Edward of Sudbury. The name of his mother was Rebecca Beaman. She was born in Princeton and lived to the great age of eighty-seven. In the primitive days of her girlhood it was the custom of the girls of her neighborhood to fetch the Princeton letters from Worcester, their nearest post-office ; and Rebecca took her turn with others. Alone, on horseback, guided only by "blazed" trees through the "forest primeval," the intrepid maiden often made her way in the performance of this service.

The house in which Edward A. was born his grandfather had built in 1786. Large, roomy, with stately elms in front and standing on the highway from Boston to Deerfield and "the back towns," it was well suited and situated for a tavern ; and as such the father of Edward A. opened it to the public about the year 1823. By the wayside swung the sign bearing the inscription, "E. Goodnow, Inn." The mail-carrier of the earlier day as landlady of the new hostelry showed herself so apt in providing good cheer for her guests that the Goodnow Inn became a house of fame. Drovers of cattle, sheep, hogs and turkeys found it a place much to be coveted for a halt over night, and to make sure of their quarters were wont to give notice of their coming, in advance. Then for a night the premises would be populous. The driven cattle browsed in the adjoining field or rested their jowls on each other's necks, while roosting turkeys filled the apple-trees with unwonted crops. The inn was kept open for twenty-one years and then closed. The fine old house, now the residence of William B. Goodnow, is still in a state of excellent preservation and bids fair to outlast the second century on which it has already entered.

<sup>1</sup> By Chas. E. Stevens.

*E. A. Grosvenor*

Tavern life is well fitted to quicken a boy's wits and make him alert. In a measure, also, it is a substitute for travel; the wide world comes to him instead of his going forth into it. The boy Edward Augustus had his full share of such influences and they did much in fitting him for his after life. The common school also did something; and three terms in Hadley Academy did something. This was all the strictly educational outfit he received. Farm work occupied a large part of his young years, and to work of all sorts he was well inclined. But he had a set rather towards trade, and at the age of nineteen went to work for wages in the store of an elder brother in Princeton. At the end of two years or so, the brothers formed a partnership which continued for about ten years. The general business of a country store, the manufacture of palm-leaf hats and the marketing of country produce made up the business of the firm. For several seasons Mr. Goodnow was his own teamster, rising at two o'clock, driving forty miles to Boston, and spending a good part of one night on the road. This was a regular weekly trip. In 1836 the firm took in a third partner with a view to engaging in the manufacture of shoes. At a later period Edward A. sold out his interest in the concern and engaged in the shoe manufacture by himself. Meanwhile he had taken to wife Harriet Bagg, a daughter of Dr. Henry Bagg the leading physician of Princeton, with whom he lived happily for some five years. After her decease Mary Augusta, the only remaining daughter of Dr. Bagg, became his second wife; but after a like period of domestic happiness her decease also left him once more alone. His next matrimonial venture proved more fortunate. In 1846 he secured the hand of Catharine Bowman, eldest daughter of Seth Caldwell Esq. of Barre, by whom for the next quarter of a century his home and all his social surroundings were made a source of unalloyed satisfaction to himself and his friends.

At the age of thirty-seven he found that the limitations of country trade in a country town were not giving him his chance and he began to look out for a broader field. Accordingly, in 1847 he sold out his Princeton business and left the town. During the period of "prospecting" which followed he had charge for a time of the store connected with the great cutlery establishment of Lamson, Goodnow & Co. at Shelburne Falls, making sales at the rate of \$60,000 a year. But neither this nor a manufacturing prospect in central New York offered him the chance he was seeking. Then he retraced his steps and in the city of Worcester found his chance. He was now forty-two years old, with small capital but large capacity, untiring energy and thorough practical training. In Princeton he had become familiar with the ins and outs of the shoe trade and had seen that, of necessity, it was one of the leading industries of the country. At the same time, he was well aware that abundant competition awaited each new-

comer. Notwithstanding, he felt that still it was the shoe trade which offered him his best chance, and that if he was to stand well on anything it must be on shoes. Accordingly in 1852 he bought out a small concern in Worcester and began. Retail and jobbing were combined, but the trade was chiefly of the retail sort. Mr. Goodnow soon learned that if money was to be made in large amount it must be by the jobbing business. At the end of four years, therefore, he sold out the retail branch and proceeded to establish the first exclusive jobbing house of any kind in Worcester. This jobbing business was conducted in a store under Mechanics Hall. For the first year it amounted to \$130,000. At the end of ten years it had increased to nearly \$400,000.

He was in the thick of this prosperity when the Civil War broke out. It did not daunt him in the least. On the contrary, he welcomed the issue, since it needs must be, and gave himself to the cause of the Union with all his soul. He had long been preparing for the crisis. In Princeton years before he had adopted the principles of the Free Soil party, being among the first eight, and he felt the war to be the legitimate outcome of those principles. With these views he was forward in doing his part. Thirteen of his clerks one after another, encouraged and helped by him, enlisted in the Union ranks. One had his wages continued while he was gone and his place kept open for him against his return. The proposal of Governor Andrew to raise a regiment of colored troops engaged his liveliest sympathies, and he headed a subscription with \$500 for their equipment. All the while he maintained unswerving confidence in the government and the final success of its cause. He subscribed liberally to the first issue of its bonds in the face of distrust in high quarters. And when the national bank act was passed and the old state banks were backward in reorganizing under it, he took a leading part in forming the First National Bank, which because of such prompt show of confidence was made and continued for many years the exclusive depository of the government funds.

With the close of the war he closed up his business and gave himself a respite. After a year or two of leisure he accepted the office of president of the First National Bank to which he had been unanimously elected. In some banks the president, full of other business, is often only a figure head; Mr. Goodnow was the real head. Able boards of directors, accomplished cashiers, expert tellers and other officers did their full share in promoting the prosperity of the bank. But the potential voice was still that of the president. All the paper passed through his hands and he passed upon it all. He took risks which timid men never dare to take and ignorant men never know how to take. He secured large deposits by a liberal attitude towards

depositors. For many years the First National was the only bank in the city which offered interest on special deposits subject to check at sight. Men with large balances were quick to see the point. Because of this, a prominent director in another bank made a deposit of \$20,000 at one time. The results of this policy were disclosed by the magnitude of the item of "individual deposits" in the published statements of the bank's condition. Then, as he was ready to pay interest on the deposits in his own bank, so he was careful to obtain the best possible interest on the deposits by his own bank. On first taking the management he found the bank had been receiving what he deemed an inadequate rate from its Boston depository. This he increased by one per cent., which, in the aggregate, gave the bank a handsome addition to its income. When he took office the stock of the bank had a market value of 110; under his management its par value was doubled. On a capital of \$300,000 the surplus was raised at one time to more than \$200,000. Of fifty or more semi-annual dividends, only one or two were at the rate of nine per cent., while all the rest were at the rate of ten and twelve. For many years the uniform rate has been ten per cent. In recognition of Mr. Goodnow's agency in producing this great prosperity, his associates on the board and the stockholders at their annual meeting in 1881 unanimously adopted and made of record these resolves:

1. That the present high degree of prosperity of the First National Bank of Worcester, placing it among the foremost banks of the Commonwealth in the ratio and amount of its surplus, the percentage of its dividends and its financial standing, is largely due to the management of its president, Mr. Edward A. Goodnow;

2. That the thanks of the stockholders be and they hereby are tendered to the President for his long and untiring devotion to the interests of the bank and for the great success achieved in its behalf.

The secret of this success was an open secret. Mr. Goodnow gave himself wholly and absolutely to the business of the bank. "This one thing I do" was his motto. An eminent member of the Worcester bar, still living, was wont to say that in a suit he knew no one but his client. "All his might, mind and amity" were engaged for him. Towards all others in such an issue he was relentless. Of Mr. Goodnow also it might be said that he was relentless for the bank. His financial pity was reserved for that; and no stockholder was ever known to complain.

We have seen how Mr. Goodnow made his money. It will be interesting, and pleasant, also, to see what he has been doing with it. In early life he became, as he hoped, a christian and took upon himself a vow to live and do for others. This he remembered; and as his gains increased he increased his giving. He had of course his choice among the objects incessantly presented for his favor, but still his chosen objects were both numerous and various. To the great benevolent societies he was a large and con-

stant giver. His subscriptions to the city missions commonly headed the list. His own church shared largely in his giving, of course; but other churches also shared largely. To more than one he gave a communion service. To one not his own he gave \$500 for its organ. Again, he gave in order to provide a free gospel. When a new church was about to be organized in the city he left his own and joined the new to help make it a free church. In the meeting for organization he made a motion to that effect; and in proof that he meant what he said gave \$1500 a year to secure free seats for all. He hated a church debt and gave an organ and chime of bells costing about \$11,000 as an incentive to the extinguishment of such a debt. All such giving was open and more or less read of men. But unnumbered private gifts went out of his hand of which no man can tell the sum but to which this writer can testify. The aggregate of his gifts at the time of writing this sketch exceeded \$200,000.

In the beginning it was said that Mr. Goodnow's munificence was bestowed largely for educational uses. It may now be added that much the larger part was so bestowed. The amount given in this way cannot have been less than about \$140,000. Scholarships for needy and worthy girls was a favorite because self-perpetuating form of educational investment. Probably not less than fifty young women are to-day receiving their education at Mt. Holyoke, Wellesley, Northfield, Oberlin, Berea in Kentucky, Hampton in Virginia and elsewhere, because of Mr. Goodnow's charitable foundations at those schools. And the procession will go on until a hundred times fifty will have had reason to remember the name of the founder as interwoven with their own best history. Besides scholarships, many thousands were given for the erection of educational buildings. When a cyclone swept away the entire group of Iowa College buildings, Mr. Goodnow gave \$15,500 to provide for the erection of a building of stone for library and observatory and of a cottage for the accommodation of the female pupils of the College. Another sum of \$15,000 was given to Huguenot Seminary in South Africa for a building there. Huguenot Seminary was conceived on the plan of Mary Lyon's School. To aid in realizing the plan graduates from Mt. Holyoke were called for, and among others Miss M. Lizzie Cummings responded to the call. After a time it was found that a large Hall was exceedingly needed and Miss Cummings returned to America in quest of funds for the purpose. She presented her cause in public and private but failed to obtain much help. Then she bethought herself of her cousin, Mr. Goodnow. Her appeal touched his sympathies and secured all the help she needed. Because of entire lack of timber in the region the frame was prepared in this country and shipped to South Africa with all the requisite furniture. In due time the building stood complete and was named by the Seminary authorities

*Goodnow Hall.* Then the grateful pupils of their own motion prepared and transmitted to the giver a handsomely illuminated testimonial to which were appended their autographs to the number of one hundred and sixty-nine.

Other educational gifts were: the sum of \$5000 to found a John Brown Professorship in Washburn College, Kansas; \$5000 to provide the Catharine B. Goodnow fund for the Young Women's Christian Association of Worcester; \$700 to the Worcester Polytechnic Institute; to Worcester High School a marble bust of Gen. Grant and marble tablets inscribed with the names of soldier-students who died for their country; to Mechanics Hall life-size portraits of President Garfield and Vice-President Wilson.

But his crowning educational gift was reserved for his native town. In 1884 he completed and gave to the town a building which he named *Goodnow Memorial Building*, in memory of his first two wives and only child. Constructed of granite and brown-stone finely harmonized in color, with a clock-tower and clock and bow front and gable, and standing on a most commanding site, the building presents to the eye an object of exquisite architectural beauty. Its design embraces the double purpose of a library and a school. Two rooms are specially fitted and furnished for a graded grammar school. The decoration within answers to the beauty without. A charming reading-room occupies the ample bay and looks out over a landscape that stretches miles away. Accompanying the gift of the building was a gift of five thousand dollars in money to provide for the care and repair of the building the purchase of books for the library and the beautifying of the grounds. Including some thousands of dollars given towards the construction of the attractive Town-Hall which stands near, the whole gift amounted to about forty thousand dollars. When both buildings were completed and all things were ready, the busy town turned aside from its business and on the 6th of September 1887 gave itself up for the entire day to an elaborate dedication of the two buildings.

It is one of the distinctions of Mr. Goodnow that he has never been an office-holder nor an office-seeker. One office of much responsibility and no emolument came to him unsought. In 1867 he received from Governor Andrew the appointment of trustee of the Westborough Reform School for a term of three years. At the end of the term he was re-appointed by Governor Bullock. Although a very busy man, he gave himself up to the service of the institution beyond the ordinary measure of his duties. He was especially in earnest to provide for the moral and religious instruction of the young wrong-doers who thus came under his official supervision, and to that end he did not spare his own purse.

Mr. Goodnow has had his trials, but they have not hardened his heart nor closed his liberal hand.

#### GEORGE CROMPTON.

The textile manufacturing interests of New England have heretofore been greatly benefited by the skill and inventive genius of men from the Old World. And to the Crompton family, especially, much is due. The father of the subject of this sketch—William Crompton—who was the inventor of the widely known and highly approved Crompton loom, was a Lancashire man; but neither he nor his son, George, had ever been practical mechanics or had worked at machinery; yet from true theoretical knowledge both father and son were destined to accomplish great wonders in the art of weaving. Cartwright was the inventor of the power-loom, but his loom could only weave heavy fabrics, like sail-cloth; not a yard of fancy cassimere was ever woven by power till William Crompton's invention. To the fulfillment of the demands of the time William Crompton sedulously devoted himself. One or two mills were established by him in Worcester County, and for a time he prosecuted a thriving business. But he finally became financially embarrassed; not, however, before he had, by his skill, inventions and suggested improvements, given an impetus to manufacturing—an impetus which is felt to this day. The Crompton loom has a world-wide reputation, and the works, at this time, are among the most extensive in Worcester, second only, indeed, to the wire-mills.

George Crompton, to whom this sketch refers, was born in Tottington, Lancashire, England, on the 23d of March, 1829, and came to this country when about ten years of age. Up to the time of his father's failure he had had nothing to do with the mechanical part of the mill, but simply kept the books. At the time of the failure, being left entirely to his own resources, he entered Colt's Pistol Factory, at Hartford, and remained there about a year, at the end of which time he began himself the manufacture of his father's loom, at Worcester. The knowledge gained while at Colt's factory enabled him, when the Civil War commenced, to enter upon the business of gun-making, which he pursued to great pecuniary advantage. But the principal business of his life was loom-making, which, having languished during the war period, on the return of peace, again became exceedingly profitable.

Mr. Crompton was gifted with a power of keen insight into mechanical principles, and the adaptation of mechanical appliances—a fact which is abundantly testified to by his having secured more than a hundred patents, most of them connected with manufacturing machinery.

It cannot be said that Mr. Crompton, during his whole business career, was uniformly successful, or above the common vicissitudes incidental to business life. He lost largely by the devouring fire of 1854, and by financially crippled debtors during the war-time, and his law expenses in defending his patents drew largely upon his purse. But by his indomitable

courage, financial ability and unwearied activity he triumphed, and, on the close of a life of many benefactions, left a very large estate. He always had a tender regard for his credit, well knowing that to be a fundamental requisite for success, had a horror of long-standing accounts, and, especially in all minor transactions, kept his affairs well squared. At the time of his decease there were some seven hundred hands at his works, all well paid-up. "His inevitable rule," says the writer of the biographical sketch of him in the handsomely illustrated and well-prepared volume, published in 1888, by Oliver B. Wood, and entitled "Worcester: Its Past and Present," "was to pay his help monthly until a few years ago, when he adopted weekly payments, and it was his boast that he never failed to pay his men on the exact day named. During his earlier business years he once found pay-day approaching and no funds to meet it. He at once started on a collecting tour. The evening before pay-day found him with the money in his pocket, but on the wrong side of the Connecticut River, swollen with a spring freshet and filled with large cakes of ice, with no bridge in the neighborhood upon which he could cross. He hunted until he found a boatman with a small boat, who was willing to risk his life for an adequate compensation, and the two started across the river. It was several hours before they landed on the opposite shore, at a long distance below the starting-point, and completely wet through, but Mr. Crompton's men were paid before night on their regular pay-day."

Mr. Crompton was a man of taste in its broader sense, and an admirer of the beautiful, as well in art as nature. His elegant residence, surrounded by finely embellished grounds, and commanding extensive and rich landscape views, and within supplied with many works of art and objects of refined adornment, give evidence of ample means and cultivated taste. Worcester, with its breezy hill-tops, sunny acclivities, and in every way charming surroundings, affords numberless lovely sites for residences, and many are becomingly occupied. But very few, if any, of the estates yet to be seen are more attractive than the Crompton.

Mr. Crompton was, in 1853, united in marriage with Miss Mary Christina Pratt, a daughter of Charles Pratt, of Cork, Ireland, by whom he had twelve children, nine of whom are living.

Mr. Crompton was remarkably quick of apprehension, very social in his habits, and loved to relate in anecdotal form his early experiences, often giving a humorous or pathetic turn to his recitals or impressing some useful thought. He was a deep thinker, and had a wonderful power of mental concentration and self-abstraction, insomuch that he was sometimes called absent-minded. He was educated in the private schools of his native town, and continued his studies till his seventeenth year at the Millbury Academy, at the end of which time he became his

father's clerk. But, although obliged to leave school so young, because his rapidly developing talents made him invaluable to his father, he continued his education at home. His father procured a good library and his son profited by it.

Mr. Crompton was not especially active in public life. He, however, served as alderman and as a member of the Common Council of Worcester, a year or two in each position, and in 1871 he was a candidate for the mayoralty. He also took such a strong interest in public affairs as led to exertion in behalf of any project that promised benefit to the city.

#### BENJAMIN WALKER.

Mr. Benjamin Walker, whose death occurred on January 28, 1888, was a citizen whose active life was identified with the life and growth of this his adopted home. He was descended from a line of Worcester County yeomanry, though he was born (November 8, 1808) in Greenfield, to which place his father, Benjamin, had removed from Barre, the old home of the family. His mother, Nancy Lee, was the granddaughter of Henry Lee, one of the original proprietors and early settlers of Worcester, a selectman, assessor and justice of the peace. This Lieutenant Henry Lee, a native of Concord, descendant from John Leigh, who came from London in 1635 and settled in Ipswich, was evidently a man of strong character. His name appears very frequently upon committees appointed by the proprietors; he was granted a prominent position for his "pue" in the first ("Old South") meeting-house; but his independence and firmness are strikingly portrayed in a letter, preserved in the State Archives (Vol. 102, page 153), in answer to a circular letter from the secretary of the province, denouncing the "Land Bank Scheme," and ordering the courts and magistrates "to prevent the spreading of the great fraud," and "by no means to pass, receive or countenance" the bills issued by the bank. Squire Lee replied that he had examined the scheme and was determined to support it; that his privilege as an Englishman was sufficient warrant therefor; that to be punished in any way for differing with the Governor and Council in his opinion would be a civil persecution; and to be deprived of his office until he were proved unfaithful in it or violated the laws of the land would be an invasion of his natural rights, but that to sacrifice his post for the interests of his country would be infinitely more honorable than to keep it on the base conditions of blindly following the inclinations, not supported by laws, of those above him. The letter was dated April 14, 1741, and on the 30th he was removed from his office of justice. His death followed within a few years.

Mr. Walker came to Worcester in the spring of 1834. He had learned the trade of a blacksmith in New Salem, and followed it for a year or two at West

*Benj Waller*

*William Foster.*

*Culver, Foster.*

Boylston. But this great stage centre offered a better opening for his business than did the smaller towns, and establishing himself on Columbia (now Exchange) Street, he set to work to hammer out the foundation of the competency which he was to leave to his family. He was six feet of stature, with a strong frame and a face in which amiability and strength of character were commingled. An intimate friend of Mr. Walker's, his neighbor in business for several years, says that he seemed from the first to be guided by a determination to meet all his obligations; he believed in work and always earned his breakfast before he ate it.

The last forty years of Mr. Walker's life were spent in a pleasant and remunerative business, which gave him sufficient leisure to attend to duties which his fellow-citizens imposed upon him. About the year 1848 Dr. Benjamin F. Heywood introduced into Worcester the system of supplying private families and hotels with the luxury of ice, obtaining his supply from the pure source of Lincoln's Pond, immediately west of the present residence of P. L. Moen, Esq. Two or three years later Mr. Walker and the late Stillman S. Sweetser purchased the outfit and rights of Dr. Heywood, secured the right to cut ice from the larger pond of Mr. Salisbury, and for several years occupied the field without competition. Mr. Sweetser retired after some years. Later Mr. L. G. White, son-in-law of Mr. Walker, was taken as a partner, and Coes' Reservoir was secured for an additional and purer supply of what is regarded no longer as a luxury, but as one of the necessities of life.

Mr. Walker's innate sound judgment was of great service to himself and to the community. It led him to make some excellent investments in real estate, and he was often called upon as an expert in the appraisal of property. The Worcester County Institution for Savings, of which he was for twenty-one years a trustee, called him to serve on its Board of Investment; and on the creation of the commission to manage the trust funds of the Jaques Hospital he was appointed a member, serving in that capacity until his death, and as chairman for the last eight years. He was a director in the Worcester Safe Deposit and Trust Company from its organization, in 1868. He served as city assessor for three years, was a member of the Common Council in 1852 and of the Board of Aldermen in 1854, 1862, 1881 and 1882. He was a zealous member of the Worcester County Mechanics' Association; and a fellow-member has declared, since his death, that "to him the association owed more than to any other man for sustaining it in the time of its financial peril and weakness."

Mr. Walker, who, as we have seen, was the great-grandson of one of the most prominent of the original proprietors of the town, married, in November, 1837, Charlotte, daughter of Nathaniel Eaton and great-granddaughter of that Adonijah Rice who was

the first white child born in Worcester. Mrs. Walker survives, with their two children—Charlotte E., wife of Elisha D. Buffington, and Agnes Lee, wife of Levis G. White. The daughter of the last-named couple, Helen Agnes White, is the direct descendant, in the sixth generation, from Lieutenant Henry Lee and Adonijah Rice.

#### CALVIN FOSTER.<sup>1</sup>

Calvin Foster was the architect of his own fortunes. He had no ancestry to boast of, and no one to help him so much as he helped himself. He was born in the early part of the century on Court Hill in a house which stood where now stands the First Unitarian Church. Worcester was then a village of about twenty-five hundred inhabitants. On Court Hill stood the old court-house, the house in which Isaiah Thomas was then living and the printing-office from which every week he issued the *Massachusetts Spy*. In the Square below, on its south side, stood the old stone jail fronting the Salisbury mansion on the north side. Just around the corner in Summer street stood the small frame school-house where Calvin Foster learned his first lessons. In the midst of these surroundings he passed his early years. Living, as he did, hard by the court-house, it was one of his childish pleasures to watch the court officials as they passed in and out. Especially impressed on his memory was the figure of General Ward the Sheriff, as clad in official blue and buff and breeches and cocked hat and sword he escorted the Judges to and from the court-house. When past the age of seven he went as an inmate of his father's family to reside in Rutland, and afterwards alone to live in Barre. In the latter place he remained until the age of sixteen when he returned to Worcester. While on a visit to a relative in that place, he looked about for employment which he soon found in the store of Caleb Newcomb then standing on what is now Harrington corner. Mr. Newcomb was a manufacturer of tinware and a dealer in stoves hardware and metals. The parental consent having first been obtained, Calvin engaged himself as an apprentice to this business. His time was divided between benchwork in the shop and selling goods in the store. At the former part of his duties he proved to be less apt than at the latter. "Calvin," said his employer, "you're a better salesman than mechanic" and so kept him chiefly in the store. He however learned enough of the mechanical part of the business to furnish him with a practical knowledge of the class of goods which was afterwards to be the basis of his fortune. In this situation he remained until after his majority when he went to Fitchburg and bought an interest in the hardware business of Horace Newton. This was in September 1834. Remaining un-

<sup>1</sup> By Chas. E. Stevens.

til the next April he then sold his interest and returned to Worcester. Meantime he had attracted the favorable regard of Col. Ivers Phillips who manifested his interest by appointing Mr. Foster on his staff as adjutant of the "(light infantry) regiment in the second brigade and sixth division of the militia of the commonwealth." This appointment, so flattering to a young man, was accepted by him and confirmed by a commission from Gov. John Davis. The old compulsory militia system had just before given place to the volunteer system and the young adjutant was one of the officers who assisted at its inauguration. His first muster-field was in Leominster where he formed his first regimental line. A restive horse by rearing and plunging severely tested his nerve in the face of his troops; and while he was in the air a private stepped forward to seize the bridle and bring him to earth. But Adjutant Foster declined the proffered aid and conquered the misbehaving steed for himself. Having made proof of his military efficiency he was, in the following year, 1835, elected major of the same regiment; in 1837 its lieutenant-colonel, and a year or two later its colonel. His next muster-fields were successively in Princeton, Westminster and Sterling. Before occasion arose for acting under his commission as colonel he had obtained his discharge and brought this military episode to an end.

Several years before, he had resumed his old place in the establishment of Mr. Newcomb. Continuing in it as clerk until 1840 he then bought out his employer and formed a partnership with Amos Brown under the name of C. Foster & Co. At the end of two years Lemuel I. Fox was added to the firm. In 1848 the death of both partners opened the way for Augustus Whitman who came in as one of the company in the following year. The accession of David Whitcomb in 1855 was followed at the end of two years by the purchase of Whitman's interest. Through all these years and with all these partners the firm name continued unchanged and so remained until Mr. Foster himself retired. In 1836 the business had been removed from Harrington corner to a frame building on the corner of Main and Pearl streets. This building was of two stories and of the same length as the fine brick and iron block by which it was superseded. It had been erected by Hon. Charles Allen about the year 1825 and occupied by Daniel G. Wheeler & Co. as the first exclusive dry-goods store in Worcester. The new block was erected by Col. Foster in 1854 and first occupied by his firm for the hardware business in March 1855. The front was constructed of iron from flagstone to roof finely relieved in each story by columns of the Corinthian order and noteworthy as being the first iron front in New England. Before commencing the building Col. Foster had conceived the idea of a new bank with a part of the new block for a banking-house. The scheme met with the warm approval of

friends whom he consulted. With characteristic promptness he at once proceeded to obtain subscriptions to the stock and had \$75,000 on his paper before beginning to build. With some aid from others the subscription was increased to \$300,000 which was the amount of capital proposed. A petition for a charter was now prepared and presented to the legislature. Quite unexpectedly, the committee to which it was referred came to the point of making an adverse report. Worcester, it was said, did not need another bank. An intimation of what was impending reached the ears of Col. Foster before the report was made. Without loss of time he called a trusty person to his aid and set him at work to collect and classify all the statistics of the various branches of business and of the mechanical and manufacturing industries of Worcester. In two weeks the work was done and laid before the untoward committee. This brought the charter with a capital of \$200,000. Though less than asked for, the amount was accepted to be afterwards increased to \$400,000. The new bank, named the City Bank, was first opened for business in September 1854 on Harrington corner where it remained till the January following when it was removed to the new building, by that time completed, on the Pearl street corner. The organization of the corporation was effected in the law office of Henry Chapin on Foster street. A list of directors made out by Col. Foster was duly elected. The question then came up, who should be the President of the bank? Several named Colonel Foster; and there was no doubt that he could have been elected had he desired. But he refused the honor and steadily remained content with the office of director. Once launched, the bank had a career of prosperity for many years; and then, by the wrong-doing of one, fell into mishaps. From having paid ten per cent. dividends it fell to passing its dividends. Then it became clear that the man to put at the helm was the man to whom the bank owed its origin. Accordingly, Col. Foster was made President and the management placed in his hands. The good effects of this course soon began to appear. Payment of normal dividends was resumed, and in no very long time the surplus had risen from \$53,000 to \$170,000. And this was largely the result of a new and distinct line of policy proposed by the new President. He believed in going west for loans. His experience as a hardware merchant had let him into this secret. His associates came round to his point of view and a maximum of profits with a minimum of losses amply justified the policy. In all this it is not intended to under-estimate the important share which the board had in restoring the prosperity of the bank. No one could be more forward than Col. Foster to recognize their claims in that respect or less forward to assert his own.

Besides the City Bank, Col. Foster had a prominent part in the organization and administration of various

other corporations. Of the Worcester Safe Deposit and Trust Company he was one of the projectors and the first to procure subscriptions to the stock; heading the petition also for a charter. The primary design of this institution was to relieve the bank vaults which had become inconveniently crowded with the private boxes of depositors. When this was found to be unprofitable the charter was enlarged so as to make it a bank of discount also. The People's Savings Bank was another monetary corporation which he helped to organize, although at the time a trustee of the Worcester County Institution for Savings. When, some time after, a law was passed that no person should hold any office in two Savings banks at the same time, Col. Foster elected to remain with the one of which, if not the father, he was at least the foster-father. This, though the youngest of all the Worcester savings banks, has outstripped all except the oldest. From the beginning Col. Foster was one of its vice-presidents and one of the board of investment. Still another concern of which he was one of the originators was the Bay State Fire Insurance Company. It was the second stock company of the kind in Worcester. Unfortunately, the great Boston fire came before it was in a condition to resist that tremendous onset, and like many others it went down.

With the railroad system of Worcester Col. Foster identified himself from the first. The Nashua, Norwich and Providence roads all felt the benefit of his aid. But his sympathies and efforts were chiefly devoted to the Gardner road. To retain the northern trade of the city and to prevent the division of the county were the two objects which he proposed to accomplish by this enterprise. In the lead were Levi Heywood, Stephen Salisbury, Calvin Foster and Ivers Phillips. But the building of the road proved to be a hard job. The subscriptions went on slowly. Col. Phillips, who had been enlisted to work up the enterprise, after awhile became disheartened and declared he had a mind to give up the business. But Col. Foster kept him in heart, put him in the way of getting subscribers, and staid by until the road was built. It is the testimony of a fellow-director that Calvin Foster did more for the road than any other man in Worcester. He became one of its directors and also one of the executive committee and so remained as long as the road retained an independent existence. At one time he was elected President of the road, but this position he absolutely declined.

When Worcester became a city in 1848, he was elected a member of its first common council, Governor Lincoln being the first mayor. He thus had a hand in shaping and giving character to the new organization. Two or three years after, under the mayoralty of Isaac Davis, he was elected upon the board of aldermen. During this period of his connection with the city government Edward Everett came to the city to repeat his oration on Washington. A re-

ception was tendered to him by the city government, and it fell to the lot of Col. Foster as one of the reception committee to express the words of welcome to Mr. Everett. This for the first time brought him into personal relations with the commander in chief from whom in early life he had received one of his military commissions. Gov. Everett was affable and Col. Foster greatly enjoyed his conversation. It all ministered to a desire which he habitually cherished of seeing and hearing and, if it might be, conversing with persons of distinction. On going to reside in Fitchburg he had met and made the acquaintance of Gov. Everett's brother, Alexander H. Everett, who invited him to his house and loaned him books from his library. In his youth he had been wont to spend his leisure hours in the court room for the purpose of gratifying this laudable curiosity. In this way he had the rare good fortune, as he esteemed it, of seeing and hearing Daniel Webster at the bar. Many years after, he met Mr. Webster as a fellow traveller on the same steamer. The two being alone in the saloon, Mr. Webster accosted him and a conversation ensued. In the course of it Col. Foster told of having seen him at the Worcester bar. "And how did I look," quoth Mr. Webster. "Tall and thin, with long arms and a big head," responded the Colonel. Mr. Webster laughed, became companionable and when the journey was continued by rail they took the same seat together and on arriving at Springfield Mr. Webster invited his companion to a seat beside him at table, although in the course of the journey he had been joined by a personal friend. That Col. Foster should have treasured up in his memory this incident is not surprising in view of the hero-worship which Daniel Webster called forth from every New Englander.

It has often been said that out of every hundred men engaged in business ninety-five sooner or later "fail." Never at any time in the course of a business career extending over half a century was Calvin Foster numbered among the ninety-five.

The domestic relations of Col. Foster were a source of happiness to himself never interrupted except by death. Of his remoter ancestors he knew but little. His grandmother he had seen, and he paid her the homage of saying that "she was the handsomest woman he had ever beheld." His mother was provided with a home and tenderly cared for by him for more than thirty years and until her decease. He was three times married but outlived every wife. Of five children born to him two survive. The education that he had always felt the need of for himself he provided for them with all ample appliances and means. Nephews and nieces also were made to share in such educational provisions.

When this sketch was written Colonel Foster was living in the enjoyment of a serene old age and in the assiduous discharge of daily duty as President of the Bank of which he had been the founder.

## WILLIAM T. MERRIFIELD.

William Trowbridge Merrifield, manufacturer, contractor and builder, son of the late Deacon Alpheus Merrifield, was born at Worcester, April 10, 1807, and being connected on the maternal side with the Rice brothers, becomes identified with the earliest permanent settlers of his native town. He worked on his father's farm until the age of fifteen, the last two years of which doing his full share of labor on a farm of eighty acres; here he laid the foundation of a rare physical development. During the winter school-days he enjoyed the advantages of the district school. At the age of fifteen he began a six years' service as an apprentice at the carpenter trade. At the age of eighteen he was entrusted with the erection of several buildings, and soon after attaining his majority he erected a block of houses, a store and a mill. In 1830 he began his career as a builder, and soon became a prominent and leading contractor of that day. In 1832 he also included a general lumber business. In 1840, Mr. Merrifield put in operation one of the first, if not the first, steam-engines in Worcester, and added the manufacture of sash, doors, blinds and builders' finish, introducing into Worcester the first power planer. Two years later he erected at Princeton a steam saw-mill, and, so far as is known, this was the first engine set up in the woods for the manufacture of lumber. In 1844, Mr. Merrifield took the contract for building the Lancaster and Coach Lane Mills at Clinton, which, with the eighty dwelling-houses, and other buildings, covered several acres of ground; this being before the days of railroads, he employed fifty teams to transport the necessary building material. The contract price exceeded three hundred thousand dollars, a notable outlay at that day, and from this beginning the industrial development of Clinton dates. In 1848, Mr. Merrifield realized the advantages in making Worcester a leading mechanical centre, and with a large investment laid the corner-stone of her material growth and industrial progress. In those experimental days of industrial transition, the inventors and mechanics needed power and rooms, that they might perfect their various specialties. Mr. Merrifield furnished these at an all important era in the history of Worcester; he erected a series of buildings, exceeding one thousand two hundred feet in length, forty feet in width and four stories high, with over one and a half miles of main shafting, turned by a steam-engine of five hundred horse-power, and suitably dividing the buildings to meet the mechanical needs of Worcester at that day, and rented the same to fifty individuals and firms, many of whom now have world-wide reputations. New industries were immediately developed in these buildings, and Worcester, mechanically, was greatly expanded. From this point of beginning dates the energizing impetus which gave her the possibilities that have made her what she is. In 1854 these buildings were burned, and immediately re-built,

substantially as before, and devoted to the same general purposes. Mr. Merrifield has always retained his natural love for agriculture and horticulture; upon his farm of one hundred and thirty acres he has a herd of high-grade Jerseys, having been a breeder of valuable stock for over fifty years. For twenty-five years or more he has been a prominent exhibitor at the annual fair of Worcester County Agricultural Society; for many years was president of the Worcester County Horticultural Society which made large drafts upon his green-houses at their annual exhibitions; his contributions of rare exotics and specimen plants added much to the society's success. In both of these honored societies he has rendered valuable aid in educating public taste to a higher level of appreciated merit. He has been a member of both branches of the city government of Worcester. In 1856 and '57 he was a member of the Legislature; he held for ten years the office of trustee of the State Lunatic Hospital, and was made a director of the Mechanics' Bank on its organization, which office he held for ten years; he was for some time president of the Worcester Mechanics' Association, also for ten years director in the Worcester Mutual Fire Insurance Company. In 1836 he was one of the first members that organized the Union Church in Worcester, and has ever since been a constant attendant. He has been married twice. On the 27th of April, 1830, he married Margaret, daughter of the late Jabez Brigham, of Worcester. William F. and Henry K. are the surviving children of this marriage. On March 9, 1847, he married Maria C., daughter of the late Captain Charles Brigham, of Brigham Hill, Grafton. One daughter survives, Harriet, wife of Hon. W. T. Forbes, of Westboro'. In common with all marked men, who have been pioneers in shaping the material growth and prosperity of a community, Mr. Merrifield has those sturdy characteristics which clearly define a strong individuality—self-reliance and even temper under the severest exigencies, a uniform courteous bearing. Kindness of speech, tenacity of purpose, courageous in action, and unconquerable by discouragements, are some of the more pronounced traits of character on which Mr. Merrifield has built a symmetrical manhood of substantial moral worth—a clear type of a sturdy, self-made, New England character, which took deep root in the early years of the century.

## PHINEHAS BALL.

Mr. Ball is a native of Boylston, Mass., and was born on the 18th of January, 1824. He was a son of Manassah Ball, who was the youngest son of Elijah Ball. His mother was Clarissa Andrews, and is still living, at the advanced age of eighty-six years. His father and grandfather were well-to-do farmers, and the farm which they owned is still in possession of the family. His education was such as the district school afforded, supplemented by a course of instruc-

*Wm. H. Merrifield.*

## HIRAM FOBES.

The best criterion by which to judge of a man is the general reputation he sustains in the community where he is best known. No one whose good qualities do not predominate will be the subject of popular commendation, the conclusion of the community being a sort of digested summary, which is not much affected by individual opinions that may be founded on personal likes and dislikes. Now, judging by this criterion, it is certainly safe to say that the subject of this sketch will not suffer. It would not do to say of any one that he is without blemishes, as that would be making him more than human. The wise historian, Hume, after speaking in the highest terms of King Alfred, significantly adds, " . . . we wish to see him delineated in more lively [life-like] colors and with more particular strokes, that we might at least perceive some of those small specks and blemishes from which, as a man, it is impossible he could be entirely exempted." No one, better than the writer of biographical sketches like those in the present volume, can realize how prone we are to view a character from one particular standpoint; in other words, to illumine the whole by radiations from one prominent trait. Perhaps the Old Testament furnishes some of the most truthful models for biographical sketches that can be found. But it would require no small degree of boldness to follow those models in many cases that occur among us. But this may seem a little overcharged as the introduction of a notice of one who makes no pretension to expand above the common condition of life.

Mr. Fobes was born in Oakham, Worcester County, on the 25th of September, 1829, and was a son of Peres and of Melissa Nye Fobes. His early life was, like that of most country youth of the period, one of industry, if not of hardship, or what in these days would be called hardship. His education, gained in the common school, was practical and available, as far as it went, and formed a substantial groundwork for the attainment in after-years, by reading, study and association with people of culture, of all that was necessary for favorable standing in a community like that of busy, progressive and fastidious Worcester.

He remained in his native town till 1846, when he came to Worcester and commenced labor as an apprentice at the provision and marketing business. And that traffic he followed in a subordinate capacity till 1854, at which time he began business on his own account in Front Street. He was remarkably successful, insomuch that in about twenty years he had accumulated enough to warrant his retirement from active trade. It was in 1875 that he closed his business in the line that had so carried him on to fortune. He did not, however, then abandon himself to indolent ease, but continued, to some extent, to deal in real estate and live stock; and by shrewd and careful management his means were considerably increased.

Few men are better known in Worcester than Mr. Fobes; and none are more respected for integrity and trustworthiness. As a citizen he stands conspicuous for liberality both in public and private affairs. His hand is never closed against the appeal of penury; and every enterprise of a public character that promises benefit to the community at large, finds in him a liberal and a working friend.

Mr. Fobes has not been much in strictly public office, though he has served in both branches of the city government. He was a member of the Common Council in 1879 and '80, and an alderman in 1881 and '82; and his course in these positions was marked by affability, prudence and a conscientious regard for the public interest. His services have, however, been in almost constant requisition in offices of a semi-public nature; in positions of trust and responsibility, where prudence, ripe judgment and vigilance were primary requisites, such as director in the First National Fire Insurance Company, director in the Safe Deposit Company and in the Street Railway Company.

In religious sentiment Mr. Fobes can hardly be ranked as a sectarian, though his place of worship is of the Trinitarian Congregational order. Theologically, his sentiments are liberal; practically, his conduct is governed strictly by the moral law. In politics he has steadily adhered to the principles of the Republican party, and, though not a zealous, or rather not a vociferous partisan, has been always ready to contribute his share for the furtherance of the policy he believed most beneficial.

Mr. Fobes was married on the 29th of September, 1870, to Celia Elizabeth Brayton, of Smithfield, R. I., and the fruit of the union was five children, three sons and two daughters, only two of whom, one son and one daughter, are now living.

## MATTHEW JOHN WHITTALL.

Mr. Whittall, who is another of those energetic and skillful manufacturers to whom Worcester is so much indebted for her prosperity, was born in Kidderminster, England, on the 10th of March, 1843. His father's name was Eli and his mother's Eliza. His father, at the time of his birth, was a hand carpet-weaver.

At the age of fourteen the subject of this sketch began his industrial life in the employ of Messrs. Humphries, carpet manufacturers, at Kidderminster. There, by his industry, dexterity and aptitude, he, within a few years, became assistant superintendent.

At the age of twenty-one he left the Messrs. Humphries, and entered the employ of T. B. Worth, carpet manufacturer, at Stourport, as superintendent of his works. There he remained till 1869, when he took a similar position with Messrs. Fawcett & Spurway.

In the latter part of 1870 he commenced a corre-

*Hiram Tobes*

spondence with the late George Crompton, with the view of coming to Worcester to superintend the Crompton Carpet Works. The result of the correspondence was that hither he came in May, 1871, and remained with the company until they dissolved, in 1879.

Mr. Whittall then returned to England and purchased machinery for manufacturing Wilton and Brussels carpets. He started business in South Worcester with seven looms, in a building owned by the Wicks Manufacturing Company. His business has greatly prospered, inasmuch that he has already built two large mills, and is now doing the most extensive business of any individual manufacturer of Wilton and Brussels carpets in the United States.

In his religious connection Mr. Whittall is a member of the Protestant Episcopal Church, and has been an officer in St. Matthew's ever since the edifice was erected, in 1871. The parish was organized in 1874, at which time he was elected a warden. Recently he has been elected president of the Episcopalian Club of Worcester.

In political sentiment he is a Republican, quietly giving expression to his views by his vote rather than by noisy demonstration.

Mr. Whittall was married at Stourport, England, October, 1868, to Ellen, youngest daughter of the late Henry Paget. Several children have been born to them, only two of whom are now living—a son and a daughter.

A great deal has of late been said against the incoming of laborers, artisans and others from foreign lands. But certainly no true statesman would object to any number of incomers were they of the character and habits of the individual to whom this brief biographical sketch relates. It is hardly reasonable to conclude, after taking a fair review of the industrial history of Worcester, that she would have attained the proud position she now occupies as a manufacturing centre had she not received and encouraged the location within her borders of some of those from other lands whose careers have been outlined in the present work. And to none, perhaps, is she more indebted than to Mr. Whittall, who, in his particular line of manufacture, presents an exceedingly beautiful and excellent style of goods, which have made not only his own name, but that of Worcester, favorably known throughout the country.

#### CHARLES B. PRATT.

Hon. Charles B. Pratt is a native of Worcester County, and is one of its best-known citizens.

His early years were marked by toil and hardship. He lacked educational advantages, and was almost without home training; yet, by his native ability and energy, he overcame these early disadvantages, which would have daunted a less determined and hopeful spirit, and achieved in his mature years not

only business success, but the highest political honors his fellow-citizens could bestow upon him.

Mr. Pratt was born in Lancaster, Mass., February 14, 1824. His parents were very poor, and at the tender age of nine years he left his father's house to make his own way in the world. He worked in a cotton-mill in Fitchburg for three years, and then, impelled by the restless spirit of adventure which marked his early years, he went to Rochester, N. Y., where, at the age of thirteen, he bound himself during his minority to learn the moulder's trade. The year following, his attention was called to an exhibition of submarine diving, and, having secured his release from his apprenticeship, he spent the next six years of his life in thoroughly mastering the details of work under water. At the age of twenty, having saved up a large portion of the money that had been paid him in wages, he returned to Worcester to finish his trade as moulder at the old Wheeler foundry. Before reaching the age of twenty-one he married Miss Lucy Ann Brewer. This union was a particularly happy one.

No small part of Mr. Pratt's success in life has been due to his happy domestic relations and to the shrewd good sense and clear-headed judgment of his chosen help-meet. Seven years later Mr. Pratt went into the submarine business on his own account, and for twenty years followed it with great success, undertaking many important and hazardous operations along the Atlantic coast and on the great lakes. He held high rank in his business, and some of his contracts were very profitable. In 1871 he retired from the submarine business in order to devote his entire time to his interests in Worcester, which had become large and engrossing.

In December, 1876, Mr. Pratt was nominated by the Democrats for mayor of Worcester. His personal popularity proved a very important factor in the campaign and he was elected over Joseph H. Walker, the regular Republican candidate, though the candidates for aldermen on the Walker ticket were elected by handsome majorities. He was re-elected mayor in 1877 and again in 1878, running on a non-partisan ticket and receiving the support of leading men of both parties. His political opponents could find no fault with his thoroughly successful, business-like administration of city affairs, and he enjoyed the entire confidence and good will of the community. During his three years in office he settled all the claims for damages arising out of the breaking away of the Lynde Brook reservoir dam, built the Foster Street extension in accordance with the terms of the legislative act accepted by a former administration, and constructed the great sewer through the ledge from Cambridge Street to Quinsigamond village, thus draining and making valuable a large tract of real estate in the "Island" district. These three items of extraordinary expenditure amounted to over five hundred thousand dollars; yet, all this work was

accomplished during the three years of Mr. Pratt's administration with a net increase of the city debt of less than fifty thousand dollars, and average net tax rate of less than \$14.50 per thousand dollars. During Mr. Pratt's administration the shiftless policy that had prevailed in regard to the management of the great funds of the City Hospital was changed, and commissioners were appointed who put into the market the land on the west side left by Mr. Jaques, thus adding largely to the material and taxable wealth of the city. It was also through his persistent efforts that the city finally carried out the conditions of the Jaques bequest, although the actual work of building the hospital was not begun until he had retired from office. Mr. Pratt gave up the mayoralty at the end of his third term in order to be able to give more time to his private business, refusing flattering invitations from representative men of both parties to accept a re-nomination. His success in the office of mayor was due mainly to his excellent business capacity, his sound judgment and his exceptional tact in dealing with men. When he first came into office he found a Board of Aldermen solidly opposed to him in politics, but he ignored entirely partisan considerations in his administration of city affairs and soon had the entire confidence and hearty support of his associates.

In 1883 Mr. Pratt was nominated by the Democrats for State Senator in the city district and was elected, receiving a majority of two hundred and twenty-six votes over the late Judge Dewey, the Republican nominee. This election was another striking proof of Mr. Pratt's popularity, for Judge Dewey's associate candidates for minor offices on the Republican ticket received between four hundred and fifty and five hundred majority in the city. During his term in the Senate, though belonging to the minority party, Mr. Pratt held a prominent and influential place. He was chairman of the Committee on Agriculture, and was active in defeating the project for a division of Worcester County, which was one of the issues before the Legislature that year. He declined a re-nomination to the Legislature.

Mr. Pratt's public career includes service in both branches of the City Council of Worcester, and both branches of the Legislature, and it is a remarkable fact that though not a member of the Republican party, which has always been in the majority in this city, he has never but once been defeated, when a candidate for an elective office before the people. Soon after retiring from the city government he was elected one of the three commissioners to manage the funds of the City Hospital, and also an overseer of the poor, both of which positions he still holds, to the great acceptance of his colleagues and all others with whom his official duties bring him in contact.

Mr. Pratt was for sixteen years president of the Worcester County Agricultural Society, and in that capacity had much to do with bringing the exhibitions

of the New England Society, of which he was a trustee, to this city, and arranging and managing the details. During the last year of his presidency of the society there was talk of selling the fair-grounds on the west side. In order to bring the land into market, Mr. Pratt suggested the expediency of running horse-car tracks to the grounds. He pushed the scheme with characteristic energy, and uniting with some out-of-town capitalists, organized the Citizens' Street Railway Company, of which he was chosen president. Under his management tracks were laid, not only to the West Side, but to South Worcester, Quinsigamond Village and out Grove Street. This was in 1886. The next year the old and new companies united, and Mr. Pratt was made president and general manager of the consolidated company, which position he now holds.

Mr. Pratt has been a leading spirit in the organization and management of several other well-known Worcester corporations. He was one of the original board of directors of the Worcester Theatre, and was its heaviest stockholder, and for years he has been a director in the Bay State House corporation. He helped to organize the L. W. Pond Machine Company, and is now its president. He has been president of the First National Fire Insurance Company since 1872, and for many years was sole manager of its business. In this way he became well and favorably known to the underwriters of New England. When the insurance companies organized the Worcester Protective Department, which maintains the Fire Patrol, he was made its president, and has held the position by successive re-elections ever since. He has been a director in the First National Bank since its organization, and has been for many years a trustee of the old Worcester Institution for Savings. He is a member of very many secret societies and social organizations. He has attained to the thirty-second degree in Freemasonry, and is a member of the Worcester County Commandery of Knights Templars. He is, besides, a member of various Odd Fellow and Pythian organizations.

Mr. Pratt possesses not only fine business tact and executive ability, which have won for him marked success in all his undertakings, but he has a kindly heart, a cordial greeting and a ready sympathy that have given him a warm place in the affections of his friends. He gives freely in private to worthy objects, but he is not one of those whose charities and benefactions are ostentatious.

#### NORCROSS BROTHERS.

James A. Norcross and Orlando W. Norcross. The names and some reference to the business of this firm cannot well be omitted from any enrollment of our representative men. For nearly twenty years their enterprise and sagacity has been creating for them a place and rank as building contractors held

by few and surpassed by no others in the United States. If there is such a thing as heredity of a calling, these brothers came naturally by their vocation. Their father, Jesse S. Norcross, was a man of remarkable mechanical ability. Their mother, whose maiden-name was Whitney, was a native of Westboro', Mass., Jesse Norcross was kept busy among the woods of Maine, setting up saw-mills. At an early age, however, by the death of their father, the sons were left dependent upon their own resources, and for a time the family were thrown upon the exertions of the eldest of these brothers. From the circumstances of the itinerant calling of the father, James A. Norcross was born in Winslow, Me., March 24, 1831, and Orlando W. Norcross in Clinton, in the same State, October 25, 1839. Through early self-dependence the sons found their way to the calling of carpenters and builders, pursuing their trade in the eastern part of this State, starting business together in Swampscott, Mass., in 1864, the association and its openings at first affording nothing more than ordinary promise. But the beginnings of success were not far away, for in 1866 the Norcross Brothers were given the contract for building the Congregational Church in Leicester, an undertaking of most modest proportions in the test of their later business, yet it seems to have proved the golden key of success, and the brothers Norcross still cherish with warmest remembrance the kindness and aid of Leicester friends who gave them their first strong assistance on the highway to fortune. Worcester had begun a marked stage of improvements, and the Norcross Brothers found here their opportunity. In the period between 1868-70 they built the Crompton Block on Mechanic Street, the First Universalist Church and the noble Worcester High School building—the latter their first structure of like prominence and cost. A few seasons later they built the beautiful All Saints' Church in this city. Their reputation was by this time established; not the reputation the heedless, lucky man leaves to take care of itself, but one to be cared for and built upon, and so it grew. The story of their work since that time gives them a succession of building triumphs, such as have in like numbers and prominence fallen to few American builders. We leave the mere list to be told most compactly, as shall follow, but no mere enumeration, however rich, can tell the whole story of such success as this—the painstaking skill, the diligence, the strength of will and purpose, that not only make fortunate circumstances, but conquer them, can only be imagined. It was the exceeding good fortune of these brothers to have been, on notable occasions, made associates with the late lamented architect H. H. Richardson, in some of the best work of that grandest of all masters and experts in stone as a material, and their work will stand with his for generations to come as some of the best known in this century. This can be readily noted from the appended list, that gives some of the best and most notable

structures of the time, in all classes for public uses—ecclesiastic, educational, memorial. To this end we have given the classification that follows, a noble story of twenty years' work by the Worcester builders, extending through thirteen States and to be summed up in millions of dollars.

**PUBLIC BUILDINGS.**—Hampden County Court-House, Springfield, Mass., contract 1872, cost \$175,000; Woburn Library, 1877, \$80,000; Ames Library, North Easton, Mass., 1877, \$36,000; North Easton Town Hall, 1879, \$50,000; Crane Memorial Library, Quincy, Mass., 1880, \$44,000; Albany City Hall, 1881, \$295,000; Allegheny County Court-House and Jail, Pittsburgh, 1885, \$2,500,000; Cincinnati Chamber of Commerce, 1887, \$530,000; Howard Memorial Library, New Orleans, 1887, \$98,000; Malden Library, 1885, \$90,000.

**CLUB HOUSES.**—Union League Club House, New York, contract 1879, cost \$255,000; Boston Art Club House, 1881, \$54,000; Algonquin Club House, Boston, 1886, \$177,000.

**PRIVATE RESIDENCES.**—Newport, Annie W. Sherman, contract 1875, cost \$40,000; Boston, Oliver Ames, 1882, \$68,000; Boston, C. A. Whittier, 1881, \$107,000; Albany, Grange Sard, Jr., 1882, \$32,000; New York, Block for Union Theological Seminary, 1883, \$60,000; Wellesley, Brownlow Hall, 1883, \$60,000; Cambridge, A. Agassiz, 1883, \$95,000; Washington, D. C., B. H. Warder, 1886, \$112,000; Great Barrington, "Kellogg Terrace," 1885, \$600,000; Boston, John F. Andrew, 1885, \$140,000; Boston, C. C. Converse, 1886, \$55,000; South Lancaster, John E. Thayer, 1886, \$85,000; Chicago, Ill., J. J. Glessner, 1886, \$85,000; Dedham, Mass., A. W. Nickerson, 1887, \$175,000; Springfield, Ohio, A. S. Bushnell, 1887, \$90,000; New York, J. N. A. Griswold, 1888, \$48,000.

**EDUCATIONAL STRUCTURES.**—Worcester High School, contract 1870, cost \$120,000; Latin High School, Boston, 1878, \$170,000; Harvard College Gymnasium, Cambridge, 1878, \$91,000; Harvard College, Sever Hall, 1878, \$104,000; Harvard College Law School, 1882, \$136,000; Union Theological Seminary, New York, 1882, \$286,000; Vermont University, Burlington, 1883, \$92,000; Lawrenceville School Building, New Jersey, 1883, \$320,000; Durfee High School, Fall River, Mass., 1886-87, \$200,000; Crouse Memorial College, Syracuse, N. Y., 1888, \$220,000; Memorial Building, Yale College, New Haven, 1888, \$135,000.

**BUSINESS BLOCKS.**—Crompton's Block, Worcester, contract 1868, cost \$75,000; Cheney Block, Hartford, Conn., 1875, \$337,000; Ames Warehouse, Boston, Kingston and Bedford Streets, 1882, \$133,000; Turner Building, St. Louis, Mo., 1883, \$208,000; Marshall Field Building, Chicago, Ill., 1885, \$900,000; New York Life Insurance Building, Omaha, Neb., 1887, \$525,000; New York Life Insurance Company Building, Kansas City, Mo., 1887, \$520,000; Burnside

Building, Worcester, 1886, \$92,000; Lionberger Building, St. Louis, Mo., 1888, \$275,000; Fiske Building, Boston, 1887, \$350,000; State Street Exchange, Boston, 1889, \$1,410,500; Ames Store Building, Essex and Lincoln Streets, Boston, 1889, \$192,000.

CHURCHES.—Congregational Church, Leicester, contract 1866, cost \$30,000; Congregational Church, South Adams, 1867, \$20,000; First Universalist Church, Worcester, 1870, \$30,000; South Congregational Church, Springfield, Mass., 1870, \$150,000; Trinity Church, Boston, 1873, \$390,000; Norwich Congregational Church, 1873, \$90,000; All Saints' Church, Worcester, 1875, \$95,700; Trinity Church Parsonage, Boston, 1879, \$28,000; Winthrop Congregational Church, Holbrook, 1879, \$22,000; Grace Church, New Bedford, 1880, \$40,000; Presbyterian Church, Albany, New York, 1882, \$80,000; First Spiritual Temple, Boston, 1883, \$120,000; St. James' Episcopal Church, New York, 1883, \$130,000; Newton Baptist Church, Newton, 1885, \$43,000; Holy Trinity Church, New York, 1888, \$185,000.

RAILROAD STATIONS.—Station at South Framingham for Boston and Albany Railroad, contract 1885, cost \$48,000; station at Springfield, Mass., for Boston and Albany Railroad, 1888, \$375,000; station at Hartford, Conn., for New York, New Haven and Hartford Railroad Company, 1888, \$200,000.

Norcross Brothers also built the Ames Memorial Monument at Sherman, Wyoming Ter., at a cost of \$62,000. It has medallions of Oakes A. and Oliver Ames on either side, cut on the solid stone, sixteen times life-size. This monument is situated on the highest elevation of the Rocky Mountains that is crossed by the Union Pacific Railroad, and commands an extensive view from this road.

The Norcross Brothers have filled a very important line of building construction, in railroad structures of the best and most permanent class, represented in the new passenger station on the Boston and Albany, Old Colony and other railroads. These contracts have been executed in the best of all known building materials, but very largely, in the case of some of the more notable structures, of the beautiful, compact and grainless Longmeadow Brownstone, which was comparatively unknown when they began to employ it about 1873. It is a material massive and not laminated, and hence free from splitting and exploitation. Another material, a favorite with them and their patrons, is what they term the Worcester granite, the fine pink-tinted stone from their quarries in Milford, in this county. Of this last material are being built the Cincinnati Chamber of Commerce and the immense structure the Court-House and Jail at Pittsburgh. The contracts of the brothers Norcross, in many instances, are such as the skillful architect best loves, an all-including affair that gives the finished building, complete. To this end no small share of their skill has been devoted to workmen and

machinery that give to the interiors their own impress of perfection.

Some of the carved wood-work from their shops has been the envy of connoisseurs. Theirs has been the art to summon to their aid the best forms of art in every department of architectural achievement and finish.

A word as to the *personnel* of the two brothers, both in the prime of active life. James A. married at the age of twenty-one, his wife being Mary Ellen Pinkham, of Peabody, Mass., eminently well-fitted for her share in the sacred contract. Nine children have blessed their union, six of whom—four sons and two daughters—are now living. Mr. Norcross takes a lively interest in the affairs of the day, and is, as is his brother, a strict and consistent friend of temperance. He was a member of the City Council in 1877.

Orlando W. Norcross, at the call of the country in the War of the Rebellion, enlisted in the Fourteenth Massachusetts Infantry, which became the First Massachusetts Heavy Artillery. He was in the service for three years. In May, 1870, he married Ellen P. Sibley, of Salem, Mass. The children resulting from this marriage have been two sons and three daughters, the daughters only living. In wide and deserved recognition of his skill as a building expert, he was a member of the notable commission set to investigate the condition of the Federal Building, Post-Office and United States Courts at Chicago, Ill., a most difficult and delicate task, which will long be remembered in building annals with the fact that no suggestion or finding of this commission has failed to be sustained by subsequent events.

#### LORING COES.

Perhaps no class have so greatly added to the prosperity and extended the fame of Worcester as her inventors, her ingenious and skilled mechanics. True, she has had the honor of reckoning among her residents, during all periods of her history, men of renown as statesmen, jurists, historians and savants, in all departments of mental culture. But it may be questioned whether all of them have done so much for the general good of the community as the mechanical class just alluded to. Any one who takes an observant round among the huge manufactories that give a busy air to almost every neighborhood cannot fail to be impressed with the idea that more and deeper thought must have been expended in perfecting some of the subtle machinery than could ever have been applied to the production of many a great book, the elaboration of many a great political scheme or the elucidation of many a great philosophical problem.

In the present volume appear the portraits of a number of those who have done good work for Worcester and not in a small degree added to her fame. And these portraits are accompanied by biographical

sketches, which, in several instances, exhibited a remarkable upward growth in individuals from native indigence to wealth and social distinction. They are all worthy of being had in remembrance, and will be so held from generation to generation, until respect for benefactors becomes a lost virtue. Among them will long stand conspicuous the name that appears at the head of this sketch.

Daniel Coes, the father of Loring Coes, was a farmer in the outlying district now known as New Worcester. Like most of the farmers in this vicinity during the first part of the present century, he was compelled to labor hard for little more than a bare subsistence, and hence was obliged to have all the assistance that his son could render, up to the age of fourteen; the opportunity which winter vacations from farm-work afforded was gladly taken by young Coes for attendandance on school;<sup>1</sup> and thus was laid the foundation for a subsequent superstructure of self-education, which ultimately proved of the most practical and useful kind.

Loring Coes was born in Worcester on the 22d of April, 1812, and consequently has now reached something more than the "common age of man" in his life's journey. On the 14th of January, 1834, he

was united in marriage with Miss Harriet N. R. Read, daughter of Russell Read, of Attleborough, Mass., and by her has had four children, two of whom are now living—Ellen S., wife of M. O. Whittier, and Chester E. B. Frank L. R., the eldest child, married Persis J. Putnam and died in 1871, leaving one son, Frank Loring. A fourth child, Annie R., died in infancy.

But the business relations of Mr. Coes form that part of his history in which this busy community would probably feel most interested, and, on the whole, would perhaps be the most appropriate in the present connection. As intimated, his first work was upon the farm of his father; then, bidding adieu to home, for some ten years, or from the age of fourteen, he worked at carpentering in Worcester and in Leicester. Then, in 1836, in partnership with his brother, Aura G. Coes, he began the manufacture of woolen machinery, and built up a very satisfactory trade. Two years after, however, they lost their entire outfit of machinery and tools by fire, a calamity which, added to the general depression which still prevailed as a lingering effect of the commercially disastrous year 1837, they were compelled to give up their hopeful anticipations and retire from a business exclusively their own. They went to Springfield, Mass., and began the manufacture of tools, hiring a portion of the Laurin Trask factory, and it was there that their inventive genius resulted in lasting benefit. While there they—for the brothers seem both to have been gifted with great mechanical ingenuity—invented that useful implement now everywhere known as the "screw-wrench," and for which they obtained a patent in 1841. They had returned to Worcester in 1840, and now set up in that town the manufacture of wrenches, which presently became a very lucrative business. In addition to the manufacture of wrenches they subsequently established a large factory for the manufacture of hay-cutters and shear-blades. The brothers dissolved partnership in 1869. A. G. Coes died, as the result of an accident, in 1875, but his sons continued the separate business commenced by him until 1888. After the dissolution of the partnership Loring Coes built the extensive factory at Coes Square, and took into partnership his son-in-law, Melvin O. Whittier, who continued with him until 1886. In 1888 the interests of Loring Coes and of the sons of his deceased brother in the wrench business were united, and incorporated under the name of the "Worcester Wrench Company." The Coes screw-wrenches were patented in 1841, 1875 and 1876. They have a world-wide reputation, and the sale must be immense. The factory buildings are pleasantly located on the margin of the picturesque sheet of water known as "Coes' Pond," which furnishes a part of the needed power. The buildings are extensive, and it is one of the busiest places in ever-busy Worcester.

It can hardly be supposed that one whose mature

<sup>1</sup> The writer has had occasion in more than one instance, while speaking of an enterprising and successful individual, to remark that his education was procured in the common district school. It is always interesting, while reading of a person, to have some information regarding his early educational opportunities. But something more is involved in the present case, namely, the value of those elementary institutions themselves. What New England would have become had not the early settlers taken anxious care in establishing and fostering a system for the universal instruction of her youth, it is useless to inquire. What she did do has merited and received genuine and unstinted praise among the thoughtful and wise. Religion, undoubtedly, was uppermost in the thoughts of our ancestors, and they looked upon learning as her hand-maid, a fact which accounts for so much pains being taken to instruct in the dead languages as well as in the elements required for common business transactions. The various grades of common schools known at the present day could not, of course, at first be established. The legislative enactment of 1647 commences: "It being one chief project of y<sup>e</sup>ould delndor, Satan, to keepe men from the knowledge of y<sup>e</sup> Scripture, as in former times, by keeping them in an unknown tongue, so in these latter times, by persuading from y<sup>e</sup> use of tongues, y<sup>e</sup> so at least y<sup>e</sup> true sence and meaning of y<sup>e</sup> originall might be clouded by false glosses of saintseeming deceivers, y<sup>e</sup> learning may not be buried in y<sup>e</sup> grave of our fathers in y<sup>e</sup> church and commonwealth, y<sup>e</sup> Lord assisting our endeavors: It is therefore ordered y<sup>e</sup> every towneship in this jurisdiction after y<sup>e</sup> Lord hath increased them to y<sup>e</sup> number of 50 householders shall then forthwith appoint one within their towne to teach all such children as shall resort to him, to write and reade," &c. . . . "And it is further ordered, y<sup>e</sup> where any towne shall increase to y<sup>e</sup> number of 100 families, or householders, they shall set up a grammar schoole, y<sup>e</sup> master thereof being able to instruct youth so farr as they may be fitted for y<sup>e</sup> university, provided y<sup>e</sup> if any towne neglect y<sup>e</sup> performance hereof above one yeare, then every such towne shall pay £5 to y<sup>e</sup> next schoole till they shall perform this order." In 1654 the court prohibited the teaching of schools by persons of "unsound doctrine." All this is sufficient to show how intimate our fathers considered the connection between religion and learning. But about "unsound doctrine," who, in this progressive age, would undertake to determine what that is? But whatever may be said for or against the common-school system, established so long ago, and continued on with modifications to this, our day, none can doubt its inestimable value. Observation need not be extended beyond Worcester itself for countless examples of its beneficial effects.

life has been so filled with private business operations on so large a scale could spare much time for the public service. Yet Mr. Coes has done well his part. For several years he served as a member of the Board of Aldermen and of the Common Council. He has been a Representative in the General Court for two terms, and his financial ability has been in requisition as a director in the City National Bank for more than thirty years, and he has honorably filled many other positions of trust and responsibility.

#### CHARLES H. MORGAN.

Charles Hill Morgan, an eminent mechanical engineer, has, for more than a quarter of a century, been prominent in the industry of wire-rod rolling and drawing in America. For the greater part of this time he was general superintendent of the Washburn & Moen Manufacturing Company, thus having been identified with the development of probably the largest wire manufacturing establishment in the world.

The Morgan family in the United States are descended from the three brothers, James, John and Miles, natives of Wales, who in 1636 came to Boston.

James settled in Connecticut, John in Virginia, and Miles joined the party that, under the lead of William Pynchon, settled Springfield. The descendants of the three brothers are numerous, and have a proud history in the various fields of commerce, mining, manufacturing, warfare, politics and law.

Charles Hill Morgan is a direct descendant in the eighth generation of Miles Morgan. He was born January 8, 1831, at Rochester, N. Y. His father, Hiram Morgan, was a mechanic in wood-working. His mother—Clarissa Lucina Rich, daughter of Dr. Noah Rich, of Penfield, N. Y.—was a woman of superior ability and force of character. Hiram Morgan moved to Michigan, and, finding the climate unfavorable, returned to Massachusetts and settled in Clinton. The advantages his son Charles had were such as the common schools fifty years ago afforded. His best schooling was at Lancaster Academy, under the charge of Isaac Woods.

When fifteen he began to learn his trade in the machine-shop of his uncle, J. B. Parker, builder of machinery for Bigelow Bros., the founders of manufacturing in Clinton. Mr. Morgan became interested in mechanical drawing, and requested John C. Hoadley, the civil engineer of the Clinton Mills, to give him lessons in mechanical drawing. Mr. Hoadley, though a busy man, engaged in large enterprises, kindly received and granted the request. Those thirteen lessons did more than any one thing for Mr. Morgan. Mr. E. B. Bigelow, knowing of these lessons, encouraged Mr. Morgan and loaned him mechanical books from his private library.

In 1852, when twenty-one, Mr. Morgan was put in

charge of the Clinton Mills dye-house. He devoted himself to the study of chemistry with great zeal, and filled his new position with entire success, and gained valuable experience in the management of subordinates.

The same year he was married to Harriet T. Plympton, of Shrewsbury. Their children were C. Henry and Hiram Plympton. The latter died in infancy.

For a time Mr. Morgan was draughtsman for the Lawrence Machine Company. Later, from 1855 to 1860, he was mechanical draughtsman for the distinguished inventor and manufacturer, Erastus B. Bigelow. In association with him and Charles H. Waters, the agent of the Clinton Wire-Cloth Mills, Mr. Morgan gained an invaluable experience and may be said to have been trained in a hive of invention.

Mr. Morgan introduced a system of designing and constructing cam curves for looms. This system proved of great value and was later the subject of a valuable paper read before the Worcester Polytechnic Institute, and subsequently published by Mr. Morgan in pamphlet form.

In 1860 Mr. Morgan joined his brother, Francis Henry Morgan, in Philadelphia, and was for two years engaged in the manufacture of paper-bags. Mrs. Morgan died in 1862, and in 1863 Mr. Morgan was married to Miss Rebecca Beagary, of Philadelphia. Their children are: Harriet, Charlotte, Paul and Ralph.

In 1864 Hon. Ichabod Washburn was in need of a superintendent for his works for the manufacture of wire at Worcester, Mass. His friends at Clinton, engaged in the manufacture of machinery and wire-cloth, warmly recommended Mr. Morgan. Mr. Washburn accordingly engaged Mr. Morgan as superintendent of manufacturing for the firm of Washburn & Moen. Four years later, when a joint-stock company was organized and incorporated under the name of the Washburn & Moen Manufacturing Company, Mr. Morgan was general superintendent. He made seven different trips to Europe for the purpose of visiting the mills of England, Belgium, Germany, France and Sweden. From these visits, from publications devoted to wire manufacturing, and from patents issued both in Europe and America, he kept himself informed of all changes made or improvements adopted. The fruit of this devotion was seen in the increased excellence, variety and amount of the company's manufactures. He was for eleven years one of the directors of the company.

An advance step in the wire business was the improvement of the continuous rolling-mill, designed and constructed in Manchester, England, in accordance with the designs of Mr. George Bedson and under his supervision. This continuous rolling constituted a great advance on the ordinary rolling previously practiced. After starting the Bedson Mill in 1869, it became evident that its production was limited by the imperfections of the ordinary hand-reel.

*Chas. H. Morgan*

Mr. Morgan's first important improvement was a power-reel operated by the engine driving the mill; the second one, the invention and construction of a continuous train of rolls, having only horizontal axes. The first continuous rolling-mill had alternately horizontal and vertical axes. Experience has shown that this mill, consisting of a series of horizontal rolls with intermediate twisting or turning guides between the rolls, giving the metal one-quarter of a turn in its passage from one pair of rolls to the next, was far superior to a mill with alternate horizontal and vertical rolls. Nine years after the construction of the Bedson Mill, another mill, from new designs furnished by Mr. Morgan, was built on the Belgian and continuous plans. This mill, the result of Mr. Morgan's studies, was known as the Combination Mill. The next improvement suggested by Mr. Morgan related to automatic reels, with a vertically moving platform. These reels were completed and a successful test made March 10, 1886, and patent applied for later in the same year. They are now in use at the company's works.

Since severing his connection with the Washburn & Moen Manufacturing Company in 1887, Mr. Morgan has been consulting mechanical engineer of the American Wire Company, of Cleveland, and has there introduced new and valuable inventions. In 1889 he completed and put into successful operation at Dollar Bay, Michigan, a large copper mill, for the owners of the Tamarack Mine, one of the mines producing the famous "lake copper," so highly prized for electrical purposes.

In 1868 Mr. Morgan designed, and Milton P. Higgins made drawings for, the first direct hydraulic elevator introduced into New England. This lift was built for a new form of annealing furnace in the Washburn & Moen Manufacturing Company's works. Mr. Higgins made valuable improvements in these hydraulic elevators, and they have ever been a most important part of the work done by the Washburn Machine Shop.

Mr. Morgan's great force of character has not been wholly confined to the above-mentioned pursuits. He has been engaged in religious, corporate and educational enterprises in the city of Worcester. He has been an earnest Christian worker in the Sabbath-school, Young Men's Christian Association and the church. He was one of the founders and deacons of Plymouth Church. For years he has been a director of the First National Bank, and president of the Morgan Spring Company.

It has been granted Mr. Morgan not only to bear a leading part in the wire industries of America, but, in his capacity as trustee of the Worcester Polytechnic Institute, to render a service of signal importance. It is probable that of these two services the last was the most indispensable. Economic interests would have called for some man to develop the wire industry, but rarely would another be found under whose

guidance the Washburn Machine-Shop would have been successful.

In March, 1886, the Hon. Ichabod Washburn made his gift to establish the machine-shop and working mechanical department of the Worcester Polytechnic Institute. That shop was to be unique in its plan. It was, to all intents and purposes, to be a business establishment and not a school. The coming of the students into the shop for instruction was to be an important feature, but a feature added to an establishment complete in itself without the students. One of the trustees of the Institute, who has served as a trustee from its founding, says:

"I regard the service of Mr. Charles H. Morgan as one of the most important benefactions ever conferred upon the people of Worcester. When Deacon Washburn endowed the machine-shop connected with the Worcester County Free Institute of Industrial Science, now known as the 'Polytechnic Institute,' everybody who took an interest in that school felt the gravest anxiety as to the result. Deacon Washburn was getting to be an old man, and his health was feeble. So far as the trustees were informed, there had been no instance in this country, and very few in the world, where an institution of education had conducted profitably a manufacturing establishment, unless the work were of the simplest and cheapest character. To undertake the management of a machine-shop, requiring a high degree of skill, and to make costly and complicated machinery, such as engine-lathes, was a most hazardous experiment.

Deacon Washburn recommended to the trustees to elect Mr. Morgan as one of their associates, with the expectation that he would give the shop the benefit of his great mechanical genius and large experience.

Deacon Washburn died before the establishment was fully under way. Mr. Morgan's sagacity, his constant oversight, his inventive genius and his great business capacity have been constantly at the service of the school. The machine-shop has been entirely successful, and is now recognized everywhere as a most important and valuable part of the institution. Its plan has been copied far and near. I will not say that no other person could have been found under whose guidance that shop would have been successful, thereby contributing the largest part of the success of the school itself, but I have never known or heard of a person who would have done it, and certainly what has been done there is largely his work."

Mr. Morgan's election as trustee took place February 27, 1866. The walls of the Washburn Machine-Shop were about half finished when Mr. Washburn was stricken down with his last sickness. To Mr. Morgan he gave the charge of finishing the shop and equipping it with machinery ready for use. He also commissioned him to select a superintendent of the shop. Mr. Morgan chose Milton P. Higgins, a graduate

of the Chandler Scientific School at Hanover, N. H. Mr. Washburn sent Mr. Higgins' name to the trustees, who elected him superintendent. From the outset Mr. Morgan and Superintendent Higgins have insisted upon having every equipment of the best quality and the best tools only used for work of the highest standard. Much of what has been accomplished in this real business shop for the practice and instruction of mechanical engineers is the outcome of Mr. Morgan's co-operation, supervision and support. No fame is more sure than that of a benefactor of a well-rounded institution of learning, certain to live and repeat its beneficent influence age after age. Mr. Morgan's title to the grateful remembrance of the students trained in the Washburn Machine-Shop will strengthen as the years go by.

#### SAMUEL R. HEYWOOD.

The portrait in this volume which bears the signature of "Samuel R. Heywood" presents the well-known features of a strong, earnest man, whose native force of character has made him one of the recognized factors in the industrial growth and substantial progress of this community, from the Worcester of a generation ago to the Worcester of to-day.

Of stalwart physique, and a natural dignity of presence, he unites with a quiet but resolute bearing, a kindliness of manner born of quick sympathies and a generous nature. A man of strong convictions and unflinching moral courage, he has been largely honored with the confidence of his fellow-citizens, and has filled such offices of public trust as have come to him, without the sacrifice of his sturdy self-respect and characteristic devotion to his own principles of life and conduct. One of the old-time Free Soilers, his first vote was cast for James G. Birney, and it naturally follows that he has been a life-long Republican. He was a member of the Common Council in 1859, and of the Board of Aldermen in 1860 and '61. In 1873 and '74 he was again elected to the Common Council, and was the president of that body the latter year. In 1875 he represented the city in the Massachusetts House of Representatives, and was re-elected for the two succeeding terms 1876-77, serving on the Railroad Committee in each session. During the latter session he was an early and efficient advocate for the election of Hon. George F. Hoar to the United States Senate, and rendered valuable service in that memorable contest. Always a stanch temperance man in precept and practice, he has always shown an uncompromising devotion to the cause of temperance, and a marked absence of those time-serving traits which sometimes determine the "availability" of a candidate for political honors.

This fact, however, has not prevented him from rendering valuable service to the State for the past ten years in connection with the administration of the system of State Charities of this Commonwealth.

In 1877 he was appointed a trustee of the State Reform School at Westboro' and he was one of the seven trustees retained by the Governor out of the whole number of twenty-one, when, in 1879, the State schools at Monson, Lancaster and Westboro' were consolidated under one management by an act of the Legislature. This position he held until 1888, and to its duties he gave much thought, and showed a sympathetic feeling for unfortunate youth, and spirit of generous helpfulness towards these wards of the State.

In business life his record is that of a successful man, whose steady progress from the start has been due to habits of industry, thrift and temperance, supplemented by more than the average amount of energy, enterprise and sagacity.

Although not generally known, it is a genealogical fact that Mr. Heywood shares a somewhat distinguished ancestry. Samuel R. Heywood was born in Princeton, Mass., Nov. 24, 1821, and was the second son of Ezra and Dorcas R. Hoar. Ezra Hoar was the son of Captain Stephen Hoar, and his father was Daniel Hoar, a native of Concord, Mass., who removed from that town early in life and became one of the first settlers of Westminster.

Captain Stephen Hoar was one of the leading business men of the town, and married Hannah Wood, of Westminster, whose family was also one of prominence in the northern part of Worcester County.

Ezra Hoar, the son of Captain Stephen Hoar, married Dorcas, the daughter of John and Dorcas Roper, the latter a daughter of Col. Timothy Kilburn, of Sterling. Both the Roper and the Kilburn families were held in high esteem in Sterling in their day and generation.

Ezra Hoar was an enterprising farmer of Princeton, and died in July, 1845, leaving a widow and nine children.

In 1848, these children, six sons and three daughters, by the authority of the General Court of Massachusetts, approved by the Governor, May 10, 1848, changed their family name from Hoar to that of Heywood.

The subject of this sketch spent his early years on his father's farm in Princeton, attending the district school in the winter season until twenty years of age, after which he continued his education for two terms at the Westminster Academy, the expenses of which were defrayed by his own earnings. These years, spent among the rugged and fruitful hills of Princeton, rooted the habits of industry, self-reliance and simple taste, and laid the foundation upon which he has builded a useful and successful life.

On leaving the academy he entered the service of E. D. & E. A. Goodnow, who manufactured shoes and carried on an extensive country store business in Princeton. In August, 1848, he engaged in the country store business on his own account, as a partner in the firm of Heywood & Warren, in Hubbards-

*Benjamin Booth*

ton, and at the end of three years he bought his partner's interest and continued to carry on a large and prosperous business until January, 1855.

In the month of February following, Mr. Heywood removed to Worcester, and became a partner of E. A. Goodnow, under the name and firm of Goodnow & Heywood, and built up an extensive business in the wholesale and retail trade of boots and shoes. This partnership was dissolved in 1856, Mr. Heywood taking the retail department, and doing a successful and increasing business until 1864, when he sold out and began the manufacture of boots and shoes, in which he has since been constantly engaged. No house stands higher in the quality of its wares, which of late years have been extended to the finer grades, and the annual product has in some years reached half a million dollars.

In 1879 Mr. Heywood erected the Wachusett building on Winter Street, which is one of the largest and best equipped boot and shoe factories in this region.

The firm of S. R. Heywood & Co. was incorporated in 1883 as the Heywood Boot and Shoe Company, with Mr. Heywood as president, and is still so continued.

In financial matters Mr. Heywood holds an important place in the confidence of his fellow-citizens. He has been a director of the Central National Bank since 1865, and was a charter member of the People's Savings Bank, organized the same year. He has served as trustee and on the Board of Investment and finance committee of the People's Savings Bank for the twenty-four years of its existence, and has been its president since 1885. He is also a director in the Cotton and Woolen Mutual Insurance Co. of Boston.

Formerly connected with the Salem Street (Congregational) Church, he has been prominently identified with the Plymouth (Congregational) Church since its organization, active in matters pertaining to the building of that edifice and the financial management, and especially interested in lifting the burden of its debt, toward which purpose he was a most generous and cheerful giver.

Mr. Heywood married Harriet Butler, daughter of Z. T. Milliken, of Chelsea, in June, 1856. Five children—three sons and two daughters—have been the fruit of this marriage. Two sons are now living, Frank Everett and Albert Samuel; the former (Harvard College, 1882) is now the treasurer of the Heywood Boot and Shoe Co., and the latter is a member of the Massachusetts Institute of Technology, '87.

#### BENJAMIN BOOTH.

Mr. Booth is another of Worcester's citizens who, though not native-born, have added largely to her renown as a manufacturing centre by their ingenuity, skill and industry. He was born in Manchester,

England, on the 3d of March, 1831, and came to the United States when nine years of age. He lived in Fall River, Bristol County, until the great fire of 1843, by which his home was destroyed and everything pertaining to it lost. After several changes of residence he settled at Lawrence, in Essex County, and became connected with the Pacific Mills as an engraver. His fidelity and ability were recognized, as was shown by his rapid promotion to positions of trust and importance. He was made superintendent of the company's telegraph, water and fire apparatus and general supervisor of their property. As a citizen he was very popular, being elected superintendent of the Fire Alarm and chief engineer of the Lawrence Fire Department, which offices he held eleven years.

It was in 1870 that Mr. Booth made his permanent residence in Worcester, being employed by the Washburn & Moen Manufacturing Company, and was soon made superintendent of their Quinsigamond Works, which position he still holds.

He grew up to be an ardent lover of American institutions, and though by no means an aspirant for political honors, has been willing to do his part in the public service. He is a Republican so far as party affiliation is concerned. But his popularity with his fellow-electors evidently rests on his integrity of character, his prudence and conscientiousness, rather than on any party consideration. In 1880 he was elected a member of the City Council from a ward that is at all times overwhelmingly Democratic; and in 1882 he was again elected, thus serving four years. In 1886 he was elected alderman, having no opponent; and to the same office he was again elected in 1888, receiving a larger majority than was ever given a candidate for the office who had an opponent.

The school education of Mr. Booth was good—quite sufficient as a foundation on which to build that after-superstructure reared day by day by reflection, association with people of culture and the reading of instructive works. He has been somewhat of a traveler, having twice visited Europe, first in 1867 and again some twenty years later. These visits, though not, perhaps, for the ordinary purposes of pleasure travel, but rather as a refreshing pilgrimage to the scenes of his early days, were well calculated to infuse new energies and impart new ideas, such as are ever circulating in so busy and so progressive a place as old Manchester. The return of Mr. Booth from both of his European trips was celebrated by his fellow-citizens by testimonials of such a character as to leave no doubt of the warm place he held in their affections.

In religious sentiment Mr. Booth is an Episcopalian, and has long been a devoted member of All Saints' Church.

Mr. Booth was married, in 1853, to Miss Chamley, of Lowell, the fruit of the union being two sons and one daughter.

Mr. Booth has been successful in life; and it

seems not difficult for one who follows his career and marks the elements of his character, to determine to what points his success is, in a great degree, attributable. We all have good intentions and aspirations; but indolence and indifference keep many lagging behind them. Mr. Booth's habits are neither indolent nor indifferent, but alert, watchful and interested in whatever promises healthful advancement. Some are sharp and unscrupulous, and by pursuing questionable ways lose the confidence of those with whom they have to deal. He has not been one of these, but conscientious and fair-dealing to the degree that wins confidence and esteem. Some, by undue parsimony and little ways of selfishness, loosen the bonds of good-fellowship; but he, by open-hearted and open-handed ways, makes friendships on every side. Some possess a haughty bearing and repellent manners, but his bearing is unassuming and his manners complaisant. In short, it may be remarked that such characteristics as he possesses will surely, under all ordinary circumstances, lead to popularity and success.

#### WILLIAM HOGG—WILLIAM JAMES HOGG.

The two portraits of father and son, which accompany this sketch, represent the second and third generation of a family which has been prominently identified with the marvelous development of the carpet manufacturing industry for over fifty years, and may be considered to rank among the pioneers of this branch of manufacture in this country.

The present representative of the family, Wm. Jas. Hogg, the proprietor of the Worcester Carpet Company, is not a native of the city or State, but is one of the many enterprising young men whose brains and capital have been attracted to Worcester as a promising field for business enterprises, and a desirable place of residence, and whose skill and energy have aided in making the city a great manufacturing centre.

William Hogg, the father, was born in Philadelphia September 3, 1820, and died June 8, 1883. He married Catharine L. Horner, the daughter of an old and well-known Philadelphia family, who still survives him.

William James Hogg is the eldest son of this union, and has four sisters living. He was born in Philadelphia June 5, 1851, and was educated in the schools of that city and Lafayette College, Easton, Pa.

The genealogical record of the family in this country begins with William Hogg, a wealthy linen manufacturer, born in Scotland, who came to this country early in the present century and settled in Northumberland County, Pa. His son, William Hogg (2d), a stanch Scotch Presbyterian, removed to Philadelphia when a young man and engaged in the manufacture of shawls and other woolen fabrics, and in 1832 he began the manufacture of carpets.

At that time this branch of industry was in its infancy in this country, and many of the present carpet manufacturing concerns in Philadelphia date their origin from this house, where their founders were employed in various capacities.

The business became prosperous, and in 1846, having amassed a competence, he withdrew, and was succeeded by his son, William Hogg (3d), who continued the business, in connection with a younger brother, James, until 1850.

This partnership was dissolved in that year, and the business was thereafter conducted and enlarged by the senior through many prosperous years.

William James Hogg began his business life with his father in 1868, and acquired an interest in the firm in 1871.

In July, 1879, he came to Worcester, and, in company with his father, bought the Crompton Carpet Company's plant, on Russell Street, changing the name to the Worcester Carpet Company, the firm-name being William J. Hogg & Co. William J. retained his interest in the Philadelphia house until 1882, when he withdrew from that firm and bought out his father's interest in the Worcester Carpet Company, becoming the sole proprietor.

He built a new mill in 1883, enlarging the weaving capacity of the mills one-third, and in 1884 he added to this plant the factories known as the Pacachoag Worsted Mills, and engaged in spinning his own worsted yarns. In 1885 this spinning plant was further enlarged to meet the demands of the rapidly growing business.

The product of the Worcester Carpet Company's Mills is Wiltons and body Brussels of the finer grades, and is sold to the trade direct, through the company's own agents. The business has been steadily prosperous from the start, and now gives employment to about 350 operatives, producing about 15,000 yards of carpet per week, and this product finds a prompt market all over the United States.

In addition to the carpet mills, Mr. Hogg, in company with Herbert L. Stockwell, bought the property known as the Stoneville Mills, Auburn, in 1887, which were refitted and furnished with new machinery for the manufacture of worsted and woolen yarns under the name of the Stoneville Worsted Company. The product of these mills is sold to the carpet manufacturers of Philadelphia and elsewhere, and gives employment to 150 operatives, nearly all of whom reside in the village of Stoneville, in cottages, all of which are owned by the company.

Like his father, who was largely interested in real estate in Philadelphia, Mr. Hogg has for several years been a large investor in building lots in the southwest section of this city, where he owns large tracts of land, which he has improved by opening new streets and building a number of modern houses for investment.

In politics Mr. Hogg is a Republican, and a firm

Wm. H. Burdett

believer in the principles of protection to American industries. He is a member of the Masonic order, and ranks as a member of the Royal Arch Chapter of Philadelphia.

William James Hogg married Frances Happoldt, of Philadelphia, in 1871, by whom he has three sons and two daughters living.

Though not yet forty years of age, he has already won a prominent place in business circles, chiefly by his own energy and enterprise, and is widely known as a successful manufacturer, a liberal and public-spirited citizen and a genial gentleman.

#### WILLIAM H. JOURDAN.

To attempt to condense the noteworthy events of a long and busy life into a brief personal sketch is to invite failure at the outset.

When the subject of such a sketch is a modest man, who is still living, the task is doubly beset with embarrassing limitations.

In the present instance only "a plain, unvarnished tale" is permitted, for wherever William H. Jourdan is known at all, he is known as a modest man, too honest and sincere in his nature and habit to covet or tolerate even the most artfully disguised form of eulogy.

William Henry Jourdan's life, from his birth in the neighboring town of Grafton down to the present time, is an open record of an honorable and successful business man, whose original stock in trade consisted chiefly in that old-fashioned family legacy,—personal industry, honesty and brains.

Thus equipped, it is not strange that he has earned a large measure of success and an honorable recognition in the ranks of Worcester's respected and substantial citizens.

The general verdict of a man's contemporaries—if such a many-sided expression were possible—during his life would be a truer estimate of his real worth than the glowing memorials which find their way into the obituary columns of the newspapers when a good citizen or a great man dies.

Tried by this standard, the quiet, genial, unassuming and generous traits of William Henry Jourdan would call forth a practically unanimous tribute of good-will and esteem from his fellow-townsmen, and a hearty assent from a widely-scattered host of friends and business associates.

These qualities of heart and mind, united with rare business tact and sagacity, sound judgment and a conservative, yet by no means narrow, temperament, and above all, an unswerving fidelity to his own convictions, have won him their natural rewards in firm friendships and easy fortunes, during his long and steadily successful business life.

In brief outline the record of his early years is that of the typical New England-bred boy and man.

Born in the rural but thriving town of Grafton

July 7, 1826, young Jourdan's educational advantages were limited to the excellent common-school system of the town.

At the age of fourteen his school-days ceased and he went to work with and for his father, with whom he remained, after the good old-time custom, until he was "twenty-one."

In October, 1847, having arrived at man's estate, he came to Worcester and entered the service of the Providence and Worcester Railroad as a passenger conductor, in which capacity he remained until January, 1850, when he was promoted to be the general agent of that corporation at Worcester.

After thirteen years of faithful and efficient service as agent, he resigned the position September 1, 1863, to engage in his present business, having bought of Thomas Sutton his interest in the wholesale and retail coal trade, established then, as now, in the Lincoln House block on Main Street.

For many years Mr. Jourdan was the sole proprietor of this constantly growing business, which has kept pace with the city in its growth from a population of less than thirty thousand in 1863 to that of over eighty thousand, during the last quarter of a century.

The present firm of William H. Jourdan & Co. was formed in 1885 by the admission to partnership of his only son, Mr. William S. Jourdan, who had been identified with the business since 1872, and Mr. William G. Strong, who has been associated with Mr. Jourdan during the whole period, and had previously served for several years in the office under Thomas Sutton.

The firm is to-day probably the largest wholesale and retail house of its kind in the State, and in the magnitude of its annual transactions is second only to one of the many great manufacturing corporations in the city.

Mr. Jourdan has always been a staunch Republican, but without a trace of political ambition in his nature.

He has, however, been called to serve two full terms on the Worcester Board of Aldermen, from 1873 to 1877, where he rendered able and valuable service during those trying years of financial disaster and hardship.

For more than twenty years he has been a director of the Worcester National Bank, succeeding Governor Lincoln on that board, and for the past sixteen years he has been one of the trustees of the Worcester County Institution for Savings.

He has also been a director of the State Mutual Life Insurance Company for many years, and served several terms on the Board of Direction of the Manufacturers' Mutual Fire Insurance Company.

Mr. Jourdan comes from sturdy New England ancestry on both sides. His mother, Susan Adams, was of the historical Adams family, her father being a cousin to President John Quincy Adams.

David Jourdan, his father, was a native of Thomp-

son, Conn., whose ancestry date back to the French Huguenots of that name, who were among the early settlers of the country.

This branch of the Jourdan (or Jordan) family settled in Connecticut; another in Maine, from which Eben Jordan, of Jordan, Marsh & Co., of Boston, is a direct descendant; a third in Virginia, now represented by General Jordan, of Confederate fame; and a fourth in Ohio.

William Henry Jourdan was the eldest of five children—one daughter and four sons—born to David and Susan, and married Emily Boyden Saunders,—deceased September 19, 1871,—the eldest daughter of Esek Saunders, of Saundersville, whose line runs back to Roger Williams, of Rhode Island.

Previous to the death of Mr. Jourdan's father, in 1884, at the ripe age of eighty-six, the family gatherings included four generations of male representatives in direct line of descent, from David to Harry Putnam Jourdan, only son of William, now eight years of age.

At the age of sixty-two years the present head of the line is still in daily attendance at his office and now, as ever, a peace-loving man, who, in all his long business career and extensive dealings with men and affairs, was never sued, or (with a single trifling exception) ever brought a suit in court; never failed to meet every financial engagement promptly, and was never known to deny an honest and deserving appeal for help or charity from his fellow-man.

If this be eulogy, may the coming generations strive to merit it in the same way and measure.

#### JEROME WHELOCK.

The picturesque town of Grafton (known since the colonial days as one of the "Praying sections" of the Indian Apostle Eliot), essentially a farming town, but long since noted for its product of men born within its borders who have gone out to join in the great conflict in life, and by their own efforts have helped push the world along, and become distinguished.

Jerome Wheelock, now so widely known the world over as the inventor of the Wheelock Engine, and the subject of this sketch, was born in Grafton, June 20, 1834. His parents were Daniel and Susan Pratt Wheelock.

One of a family of six, raised to hard labor and few opportunities, attending the common schools of the period, he received such education as the limited terms could supply to a youth who was inclined to original investigation and to do his own thinking.

A noteworthy event of young Wheelock's life was the seceding from the parental home and effectually concealing his whereabouts against the most strenuous efforts at discovery, sustaining his position until his independence was established.

The natural bent of his mind was soon gratified through the influence of the Hon. Abraham M. Bige-

low, by a situation in the Taunton Locomotive Works. Here he remained and served a full apprenticeship, and started on his career with the following endorsement from the management of the locomotive works: "A good mechanic, steady, honest and of industrious habits," from the locomotive works young Wheelock went out, turning his attention to the practice of the steam-engine, and locating in various points. Ample and interesting material would tempt to a long description of his early mechanical life; but the limits of this sketch will not admit.

He came to Worcester in 1858. Subsequently, while engaged with the Washburn Iron Works of this city, he invented the now widely celebrated Wheelock Steam Cylinder Packing, which soon commanded such recognition among steam users that it became necessary to make arrangements for its extensive manufacture. Accordingly, the firm of Wheelock & Wheeler (a co-partnership with Mr. Charles A. Wheeler) began the manufacture in 1865. By the death of Mr. Wheeler, in 1867, Mr. Wheelock assumed the business and rapidly developed several inventions.

In 1870 he removed to the shops on Union Street, where the Wheelock Engine was first manufactured, and where, in the struggle for existence for almost a decade, there was a striking illustration of "one hand washing the other," the success of many smaller inventions making money to be spent in the experiments of developing the Wheelock Engine. Long and patiently was the labor carried on.

At length, by a few devices full of that simplicity that always characterizes valuable thought, the machine was completed. The fullness of his success is best attested by the universal applause bestowed on his work by the highest grade of mechanical experts in all parts of the world. At international exhibitions the Wheelock Engine has been a prominent feature, and at every contest has been victorious. The American Institute of New York, in 1875, awarded Mr. Wheelock the great gold medal of progress (the only one ever given for a steam-engine, and considered a great honor). He also received the medal and diploma of the Centennial Exhibition, Philadelphia, 1876.

The Paris International Exposition of 1878 awarded Mr. Wheelock the grand prize, the only one for a steam-engine, and one of eight coming to this country.

The First International Millers' Exposition at Cincinnati, in 1880, offered a large award for the best steam-engine. Mr. Wheelock entered the Wheelock Engine, and, after a severe contest with the best known types, came off victorious, and received what is admitted to be the finest award in existence.

From this the growth of the engine business was rapid, and the improvements and inventions of Mr. Wheelock have been hailed almost with acclamation

*Stephen Sawyer*

throughout the mechanical world. At London, Edinburgh and Brussels, where foreigners have exhibited, the Wheelock Engine has received large gold awards.

In addition, and no less flattering, have been the encomiums bestowed in more private ways by the most competent judges and experts in all countries where machinery and mechanical principles are best understood.

The late Colonel Forney, in a letter to the *Philadelphia Press* from Paris, spoke very highly of the engine exhibited by Mr. Wheelock, and of the many favorable notices of it, and relates a conversation with a son of Mr. Wheelock, a lad of sixteen, who was in sole charge of the engine.

"Your father," he remarked, as he took the hand of the youth, "has given you a prouder name and a richer heritage than any king could give his son;" and a prominent writer, noticing Colonel Forney's remarks, adds: "Without quarreling with that proposition at all, and speaking within the sober limits which history is bound to prescribe to itself, there is no doubt that Mr. Wheelock has placed his name high on the roll of distinguished mechanics, whose works adorn their country and their age."

In November, 1855, Mr. Wheelock entered Franklin Lodge of Free Masons, and since has passed through all the successive degrees to the thirty-second. He is a member of the Worcester County Mechanics Association, the Massachusetts Charitable Mechanics' Association, the American Society of Mechanical Engineers, the American Institute of Mining Engineers, and in 1879, after his success in Paris, the Iron and Steel Institute of Great Britain made him a member without solicitation, a conspicuous honor much appreciated.

In June, 1858, Mr. Wheelock married Lydia Ann Robinson, a native of Concord, Mass., a daughter of Henry and Myra Robinson. Five children were born—four boys and one girl. Three have died, two sons are living.

In 1888 the local business carried on in Worcester was merged into a corporation, Mr. Wheelock desiring to be relieved of the local management, the better to enable a more extended development of the usefulness of his inventions.

Several large steamers, having their engines constructed on the Wheelock system—notably one of the Long Island Sound steamers, the "Connecticut," has engines of six thousand horse-power of the Wheelock system, while some of the largest manufacturing in the world are being operated by this system. Recently a two thousand horse-power engine was sent to India to operate a 100,000 spindle mill for an English house.

In politics, Mr. Wheelock acts with the Republican party. Although often urged to take an active part in public office, he has left that for others. Striving for his success in his chosen profession, he has not

been diverted by "pyrotechnics," but, doing right for right's sake, with truth, sincerity and integrity, coupled with a firm reliance on a kind Providence for his religion, few people ever attain a more wide or enviable reputation.

#### STEPHEN SAWYER.

Stephen Sawyer, son of Alvin and Sarah (Newton) Sawyer, was born in Berlin, February 22, 1813. His childhood life was in a quiet family of a quiet country town. He was the youngest of six brothers—all reared in industry and the common school. Two younger sisters settled in Worcester; Mrs. Julius L. Clarke and Mrs. E. S. Brigham.

Stephen Sawyer was diligent in scholarship, and in early manhood took on him the responsibility of schoolmaster which he bore very creditably. Industries of the farm and some mechanical labor gave him such support as satisfies many young men. He identified himself early in religious interests and the church of his fathers. In this he stood in company with a goodly number of other young men. Most of these cast in their lot with their fellow-townsmen. This outlook was not wide enough for the inherent business impulse of young Sawyer. The stir of mercantile life was more congenial to his inspirations, and more promising to his hopes. Against much sincere and earnest advice he chose to cast himself into "business life." That was the day when H. B. Claffin had inaugurated a new order of business into the already vigorous blood of Worcester merchants. Sawyer's ideas of what a business life is, grew upon him. He found an opening in the liveliest house in Worcester County. Indeed, for life and energy, we might say, in the Commonwealth. Outsiders heard of it as "dusk." But its foundations were solid business principles. Worcester soon took knowledge of H. B. Claffin. The country did, finally. Mr. Sawyer obtained there a position which met his aspirations. When Mr. Claffin sought his wider field, Mr. Sawyer was retained as salesman in the succeeding firm, Hurdon, Hunt & Brown. The firm was soon reconstructed with Mr. Sawyer as partner, B. L. Hurdon & Company. In that firm Mr. Sawyer was well-known in all the heart of Worcester County. He stood on the same ground, as it were, from 1841 to 1856. At this date, through ill-health, he retired from active business; but in sympathy still with the life of the city.

After ten years respite and recuperation, his business trend led him into partnership with T. A. Clarke, and E. W. Ball, who bought the stock of crockery, china, glassware, paper-hangings, etc., of John Firth & Company, and rented the store they occupied in Flagg's Block. They soon out-grew their accommodations, and rented two large stores in Taylor's buildings. A few years more, and these premises were again too small, and with George Richardson included in the firm, and E. W. Ball retiring, they

rented the third store, their present place of business, 475, 480, 485 Main Street, Worcester.

Nogreater assurance of a high-minded and energetic business house can be given than constant increase of trade. Clarke, Sawyer & Co. occupy more floor-room and transact a larger wholesale and retail trade than any other house of the kind in Massachusetts outside of Boston.

Increased public appreciation of Mr. Sawyer's integrity and business talent is manifest in his being chosen director in the Worcester Mechanics' National Bank, also in the Worcester Mutual Fire Insurance Company, trustee in the Worcester Five-Cent Savings Bank and one of the aldermen of the city during the mayorship of Jillson, Pratt and Kelley, together with other important trusts. Starting in life without money or influential family friends, whatever success he has attained, is but one instance among many, showing the possibilities that are within the reach of every young man.

Mr. Sawyer's first marriage took from his native town one of the choicest young ladies of one of the best families, Lucy Fairbanks, daughter of Deacon Oliver Sawyer. Her very early death was a common grief. A second happy connection was formed in marriage, December 2, 1858, with Miss Mary W., daughter of Silas and Silence (Pierce) Bigelow, of Worcester. Mr. Sawyer has often very generously aided the church of his fathers.

#### HENRY SALEM PRATT.

The portrait accompanying this sketch presents the familiar features of an unassuming, respected and prosperous citizen of Worcester.

Henry S. Pratt, the senior member of The Ware-Pratt Co., is a successful business man whose claim to this title does not rest wholly upon the magnitude of the firm's business, or the amount of his private fortune.

His success, and a modest competence, have been fairly earned by the gradual processes of steady and intelligent application to business, courage and enterprise in his methods, simple tastes and habits, and a keen sense of the value of a sound reputation for honesty and fair dealing. To summarize the stages of his business career, and to give the picture in outline, we have, a country-bred boy at the age of twelve years at work bottoming boots with his father, in the summer, and attending the village school in winter until his seventeenth year. At seventeen, beginning life in Worcester, working for his board for several months in a retail shoe-store; later, employed in a dry-goods house for two years, and then finding his level and life-work as a salesman in the clothing trade. Ten years later a partner in the firm, and for the past twenty years the head and controlling spirit of one of the largest firms of manufacturing and retail clothiers in central Massachusetts. To lend a

touch of commercial romance to the picture, we add, that he counts among other substantial rewards, the ownership of the Hillcroft farm, a valuable suburban property, on which he has lately built a fine private residence, and the Chadwick building, one of the handsome, modern business blocks on Main street, which he built a few years ago on the same site where he resolutely began life in Worcester as a boy, working for his board in the retail shoe-store.

The record of the present firm of The Ware-Pratt Company begins with A. P. Ware & Co., one of the pioneers in the ready-made clothing trade of the city, with whom Henry S. Pratt begun as salesman in 1855.

In January, 1866, a branch firm, under the name of Ware & Pratt was formed, the management of which was entrusted to the junior partner, Mr. Pratt. At the end of three years the two firms, A. P. Ware & Co. and Ware & Pratt were consolidated under the name of Ware, Pratt & Co., Mr. Pratt assuming the burden of the active management of the then struggling enterprise. The new firm at once moved the business from the Paine block to the First National Bank building, incurring a heavy rental for the times, and began that year, 1869, the manufacture of clothing in connection with the retail trade.

In 1871 Mr. A. P. Ware retired from business and a new firm was formed under the same name, consisting of Henry S. Pratt, Edward T. Wardwell, and William W. Johnson, by whom the business was successfully continued for seven years, when Mr. Johnson's interest was bought by Mr. Pratt and Mr. Wardwell.

On the death of Mr. Wardwell, in 1880, Mr. Johnson returned to the firm, taking charge of the custom department, Mr. Pratt continuing to be the general manager of the large and steadily growing business.

January 1, 1888, a stock company was formed, and the business incorporated under the name of The Ware-Pratt Company, with William W. Johnson as president, Henry S. Pratt treasurer, and Charles E. Black as secretary, a part of the capital stock also being apportioned among the faithful salesmen and attaches of the house.

The firm manufactures the greater part of the ready-made clothing sold over its own counters, furnishing employment to a large force of workmen the year round.

At the age of fifty-three Mr. Pratt is still the active manager of the business and the undisputed possessor of a good name, which stands for business integrity, modest worth and an upright life wherever he is known among men. He has been, for several years, a director in the Citizens' National Bank.

Henry S. Pratt was born in Brookfield, Mass., November 18, 1836, but was reared from infancy in Charlton, his father's native place, to which town the family returned the year of Henry's birth.

Salem Pratt, his father, married Sally Hobbs,

Henry S. Pratt

the daughter of a well to do farmer of Sturbridge, Mass., by whom he had two sons and two daughters, Henry S. being the eldest.

Captain Joseph Pratt, the father of Salem, was an officer in the War of 1812, and his father was a full-blood Indian of Maine, whose copper-colored skin and long black hair were distinctly remembered by the third generation.

In politics Mr. Pratt's sympathies have always been strongly Republican, but political ambition was an element entirely foreign to his nature, and his business cares have left him no time to cultivate this disquieting guest of a mind serene.

Mr. Pratt married, December 24, 1857, Melora Fletcher, of Worcester, and the Chadwick building derives its name from the maternal side of her family.

Both are adherents of the Unitarian faith, and share generously and helpfully in good works for humanity's sake. They have no children.

#### COLONEL FRED. W. WELLINGTON.

Colonel Fred. Williams Wellington, the youngest son of the late Timothy W. Wellington, of Worcester, and the great-grandson of Captain Timothy Wellington, of Lexington and Revolutionary fame, is the only representative of this once large family now living in this city.

Timothy W. Wellington, his father, removed, with his family, from Shirley, Mass., to Worcester in 1855, and was an honored and exemplary citizen here until his death, on the 26th of August, 1884.

The record of T. W. Wellington's earnest, helpful and kindly life is still fresh in the memories of many of his fellow-townsmen who shared with him in the growth and prosperity of the city for nearly thirty years of his active citizenship.

As a fitting tribute to his memory, in these pages, we quote the following extract from an extended notice published in the *Gazette* on the day of his death:

[From the *Worcester Evening Gazette*, August 26, 1884.]

Timothy W. Wellington was an energetic, public-spirited man during his active life, and was engaged in almost every enterprise designed to develop Worcester or add to its credit. He served at various times as alderman and in the House of Representatives of the General Court, being while there a member of the Railroad Committee, and one of its most useful members. He was for years a director in the First National Bank and the First National Fire Insurance Company, and a trustee of the People's Savings Bank. In all his business and public relations he was prompt and faithful, and his integrity was above reproach. He was proud of his good name, and of the good opinion of men, which he enjoyed in a larger degree than falls to the share of most business men. He was intensely patriotic, and the fact that he was Lexington born was always a source of great pride to him. At the centennial of the battle of Lexington he manifested great interest and reprinted, at his own expense, an edition of Hon. Edward Everett's oration at the dedication of the monument to the Revolutionary heroes there. He was intensely stirred at the outbreak of the war, and exerted himself to the utmost, not only to aid in the raising and forwarding of troops, but in caring for them in the field and for their families at home. His ample means were always held ready to aid soldiers, and he scattered money for them with a generous hand. All through the

war he was working for the soldiers and he made numerous trips to the front to care for Worcester soldiers, and on every occasion he was lavish in his expenditure for their welfare. Two of his sons lost their lives as soldiers,—one in Andersonville Prison,—and another died from the effects of army life after his return home; another also saw service in the navy. His devotion to the soldiers continued after peace was declared, and Post 10, G. A. R., has many reasons to honor and bless his memory. He was among the first to enlist in the State Guard, the home-guard of the war, and was always eager to follow the flag and show his devotion to it. For several months he maintained, at his own expense, a private hospital for the care of soldiers on Mason street in this city.

Mr. Wellington was for many years very prominent in the Masonic fraternity. He took his Blue Lodge degrees in Morning Star Lodge, in this city, in 1857; was a charter member of Montacute Lodge, 1858, and of Athelstan Lodge, 1865. He was also a member of Worcester Royal Arch Chapter, of Worcester County Commandery of Knights Templar, of the Lodge of Perfection of the Scottish Rite, a charter member of Lawrence Chapter Rose Croix, and of Goddard Council, Princes of Jerusalem, and a member of Boston Consistory, 32°. He was an honorary member of his lodge, chapter and temple at the time of his death. For many years he was Treasurer of the directors of the Masonic Fraternity here, and was one of the three who presented the great chandelier in the Templar rooms in the Masonic Hall. Mr. Wellington was a zealous and public-spirited citizen; a generous friend, a kind neighbor and a man whose charity found numberless channels for its bestowment of which the public never knew. His hand and his heart were always open, and his memory will be cherished by very many who have had reasons to bless and honor him. His death will leave an impression on many hearts not easily effaced.

Col. Fred. W. Wellington, the son, whose portrait is given in this volume, was born in Shirley, Mass., May 31, 1851, and is the proprietor of the large wholesale and retail coal business, built up under his own management during the last twelve years, and known as the firm of Fred. W. Wellington & Co.

Brought to Worcester when a child of four years, he began his education in the public schools of the city, and with the exception of two years spent in the schools of Germany and France and one year's absence in California, his life has been spent here.

He began his business life at the age of seventeen years as book-keeper in the First National Bank of Worcester, from June, 1868, to October, 1869, when he entered his father's coal-office, taking charge of T. W. Wellington & Co.'s Southbridge Street coal-yards. In November, 1871, he went to California, but returned the following June to enter the reorganized firm of T. W. Wellington & Co.

He withdrew from this firm in 1874 and became associated with J. S. Rogers & Co., in the retail coal trade for a year, and in 1875 he formed a partnership with J. S. Rogers and A. A. Goodell, under the same name, for the purpose of conducting a strictly wholesale trade in coal.

In 1876 this firm was changed to A. A. Goodell & Co., J. S. Rogers retiring, and in 1878 Col. Wellington withdrew from this partnership and bought the new Hammond Street yard, and began the wholesale and retail coal business on his own account. The following year the two firms were merged in one, under the name of Fred. W. Wellington & Co., Col. Wellington being the sole owner of the present large and growing business, with extensive yards on Hammond Street.

Colonel Wellington has been an active member of the State militia since March 27, 1882, when he was commissioned second lieutenant of Battery B, Mass. Light Artillery, Unattached. January 22, 1883, he was promoted to be first lieutenant, and to the captaincy and command of the battery September 29, 1884, and under his efficient leadership the corps maintained high rank in the State service. In January, 1887, he was promoted to be assistant inspector-general on the staff of the commander-in-chief, Governor Oliver Ames, with rank of colonel, which position he still holds.

The military instinct is a family inheritance, dating back to Captain Timothy and Benjamin Wellington, both of whom were members of Captain Parker's company at the battle of Lexington, Benjamin being the first prisoner of the Revolution, having been captured by the King's troops early on that eventful morning, but later rejoined the company. Captain Timothy Wellington, the direct ancestor of this branch of the Wellington family, was a descendant of Roger Wellington, one of the proprietors of Waretown in 1609, who later removed to Boston.

Four brothers of Col. Fred. W. were in active service on the Union side during the Civil War, two of whom gave their lives for the cause. The same patriotic ardor which inspired them, and made him the drummer-boy of the State Guards, First Company, from 1861 to 1865, would doubtless have led him to distinction, or a soldier's grave, on the battle-fields of the Rebellion had he been born a few years earlier.

Col. Wellington has also been somewhat active in politics, and took a prominent part in the memorable Tenth Congressional District contest between two factions of the Republican party in 1887. He was a member of the executive committee of the Republican State Committee for two years (1887-88); chairman of the Fourth Republican Senatorial Committee for the same years; and secretary of the Tenth Republican Congressional District Committee from September, 1886, to September, 1888.

In the Masonic order he is a member of the thirty-second degree Massachusetts Consistory, Scottish Rite, and Worcester County Commandery, Knights Templar.

Fred. Williams Wellington married, September 4, 1883, Lydia A., widow of General Arthur A. Goodell, formerly colonel of the Thirty-sixth Massachusetts Volunteers.

#### SUMNER PRATT.

The family of Mr. Pratt was of English descent. His father, Elias Pratt, Jr., was a farmer in Oxford, Worcester County. His grandfather, Elias Pratt, commanded a company of militia during the Revolution, remaining in service till the close of the war. His mother was Sally Conant, a daughter of Dr. Ezra Conant, of Oxford, and a lineal descendant of Roger

Conant, often spoken of as the first Colonial Governor of Massachusetts.

Sumner Pratt, the subject of this sketch, was born in Oxford on the 30th of September, 1809. His education was obtained in the common schools of that day, where, it will be borne in mind, the discipline was of a severely practical kind, little of the speculative or ideal then being countenanced.

When he was about eight years old the family removed to Sutton, in which place, upon coming of age, he commenced his prosperous business career. In 1844 he removed to Worcester, where he established the business of equipping cotton and woolen-mills with machinery and supplies, in which he was eminently successful.

Worcester was long years in attaining the position it now occupies. And the extended business life of Mr. Pratt enabled him to follow the city's development from a secondary town to its present commanding position—a development in which he acted a no inconsiderable part.

Without entering into the details of Mr. Pratt's business life, let it simply be said that his career was marked by industry, integrity and sound judgment—qualifications that never fail of suitable recompense in the world of trade. He was ever prompt in fulfilling engagements, even those deemed of trivial import, and methodical in all his ways. To an eminent degree he enjoyed the reputation of being a *reliable* man, and that means a great deal.

But aside from his business relations, Mr. Pratt was held in high esteem for his graces of character; for his high sense of the duty of man to man, and his constant endeavor to exemplify the same in his own conduct; for the uniform courtesy towards all classes that marks the true gentleman; and above all, for his truly Christian principles.

Sumner Pratt was not much in what is called public life, for he was of a somewhat retiring disposition. He was a member of the Common Council some three or four years, and served as alderman two years; was a trustee of the Worcester County Institution for Savings, and vice-president of the People's Savings Bank; a director of the Worcester Safe Deposit and Trust Company, and at one period president of the Board of Trade.

In politics he was an adherent of the present Republican party, in which he became enrolled from the old Whig party. But though his principles were well defined, he avoided their enforcement in any offensive way; and not aspiring to official position, was usually content that his vote alone should quietly proclaim his affiliation.

Sumner Pratt was twice married. His first wife, whom he married May 19, 1836, was Serena, daughter of Caleb Chase, of Sutton. By her he had two children, Frederick Sumner and Emma Amanda, both now living. His second wife, whom he married August 5, 1850, was Abby Curtis, daughter of Ebenezer

*Sumner Pratt*

Read, of Worcester. By her he had one child, Edward Read, who died in 1880.

At the time of his decease, January 6, 1887, Mr. Pratt was a few months above seventy-seven years of age, and his unexpected death sent a thrill through the community seldom witnessed. In the words of the litany of the church he loved, he had long been accustomed to pray that from sudden death he might be delivered; and his prayer was answered; for death is never sudden to one who, like him, is always prepared. Yet, in another sense, his death was sudden, almost instantaneous, the fatal attack being paralysis of the heart.

Mr. Pratt was a man of deep religious feeling and an exemplary member of the Protestant Episcopal Church. He long and faithfully served as warden and vestryman in All Saints' Church, and liberally contributed to the maintenance of the form of worship in which he delighted. And it was from that consecrated edifice that his remains were borne to their last resting-place. The attendance at the funeral services—which were, of course, after the appointed order of the church—was large and embraced many of the most prominent citizens, as well as a large concourse of relatives and sympathizing friends. The Rev. Dr. William R. Huntington contributed for publication a brief and touching eulogy, a portion of which may appropriately conclude this sketch: "Sumner Pratt was a representative man of whom the city of Worcester had reason to be proud. Integrity was written in the lineaments of his face, and his name, wherever known, carried a great weight of confidence. . . . He had, also, the prestige which comes of an attractive manner. There was more cordiality in the grasp of his hand than could have been easily put into a sentence. The business which he chose, or, to speak more accurately, which he called into existence,—for the very idea of it is believed to have originated with him,—was one that demanded unflagging personal supervision, and the demand was fully met. Industry he carried almost to excess. For the greater number of his active days he probably worked twice as many hours as our labor reformers think ought to be accounted lawful, and yet he thrived under it, both in body and mind. His immense correspondence, which he conducted for the most part unaided, proved a sort of education in itself; and he acquired a readiness of expression and clearness of style that would have done credit to a trained scholar. Perhaps his finest trait was his genuine humbleness of heart. There was not a shred of vanity about him, but, on the contrary, a singular capacity of reverence. This disposition, rare enough under any circumstances, is peculiarly infrequent in the case of 'self-made men.' As a rule they are spoilt in the making. But Sumner Pratt, though self-made, was as far as possible from being self-conceited. He habitually esteemed others better than himself, often doing so in cases where the impartial observer was of a different mind. . . . Both

as citizen and as churchman, he has left behind him that best heritage, a blameless reputation. Young men who are gazing doubtfully at their lives, and wondering what they are likely to make of them, will do well to look and see what Sumner Pratt made of his."

#### HENRY EMERSON SMITH.

Colonel Henry E. Smith, of the firm of Childs, Smith & Co., jobbers in boots and shoes, is one of the many patriotic Worcester County boys who shouldered a musket and went to war in the volunteer armies of the Union in 1861.

In his case the military title by which he is generally known is no hollow mockery, but one of several honorable titles, honorably earned either by long and faithful service in camp and field during the Civil War, or by subsequent service and prominence in the military organizations of the State.

Of all the honors of rank and title which have been thus earned, the one which he prizes most, and which will live longest on history's page, undimmed by the dust of years, is that of the young and intrepid "color-bearer" of the gallant Fifteenth Regiment Massachusetts Volunteers.

Entering the army as a private in Company F of that regiment, July 16, 1861, his stalwart figure and soldierly bearing speedily marked him for promotion from the ranks, and soon after reaching the field he was appointed color-bearer of the regiment. In this important and hazardous position he won distinction by his coolness and bravery, carrying the flag in all the bloody battles in which the "Old Fifteenth" was engaged, from Ball's Bluff, October 21, 1861, through the disastrous Peninsular campaign (under McClellan), the battles of Centreville and South Mountain, to the field of Antietam, where he was wounded in the leg, September 17, 1862.

The flag-staff, which was shattered at Ball's Bluff, was repaired with thongs until after the battle of Malvern Hill, when he found the handle of a tin dipper, while on a foraging excursion, from which he fashioned a ferrule to secure the fracture in a more thorough manner. This flag-staff, with its bullet-riddled ensign, is now preserved in the State-house at Boston, still bearing the ferrule made of the tin-dipper handle and carried by him through the subsequent campaigns.

The bullet which disabled him at Antietam changed but did not stop, his military career. He was sent to hospital in Philadelphia, and when convalescent was assigned to the command of the Hospital Guard at Chester, Pa., where he remained until the spring of 1864. His term of service having then nearly expired, he re-enlisted "for the war" in March, 1864, and rejoined his regiment in active service, and was again severely wounded in the breast at the battle of North Anna River, May 26th of the same year.

When in a measure recovered from this wound, he

was transferred to the Veteran Reserve Corps, as mustering officer, at Auburn, N. Y., and on July 4, 1865, he was commissioned as second lieutenant of the One Hundred and Ninety-third Regiment New York Volunteers, and assigned to duty at Wheeling, W. Va., as post adjutant. Later he served as provost marshal at Romney, W. Va., and as assistant superintendent of the Freedmen's Bureau at Harper's Ferry. In this department he established the first freedmen's schools in Harper's Ferry, Charleston, Martinsburg and Smithsfield, W. Va.

On July 18, 1866, he was mustered out, having completed over four and a half years of continuous service.

Since the war he has served in the State militia of Massachusetts as second and first lieutenant of Battery "B," Massachusetts Light Artillery, for four years, and in 1886 he was elected lieutenant-colonel and commander of the Worcester Continentals, an independent military organization of high character in the city of Worcester.

In 1878 he became a member of the Ancient and Honorable Artillery Company of Massachusetts, and at the annual meeting, June 7, 1885, he was elected first lieutenant of that honored and exclusive veteran organization. On the death of Commander Trull, November 21, 1886 (the first commander to die in office since the corps was organized in 1638), Lieutenant Smith succeeded to the command, and presided at the two hundred and forty-eighth anniversary of the corps, in Faneuil Hall.

Two years later, June, 1888, he was elected captain and commander, and during the past year has had the distinguished honor to command the oldest military organization in the country on the occasion of its two hundred and fiftieth anniversary, celebrated last June, and made memorable by the presence of a notable delegation from the parent corps of London, England, and observed as a general holiday in Boston.

In civil life Colonel Smith is widely known as a successful business man and a genial gentleman. He was born in North Brookfield, Mass., April 26, 1841; was educated in the common schools of the town, and began life in earnest, at fifteen years of age, as a shoemaker in his native town, where he worked at his trade until he left the shop for the battle-field in 1861. Benjamin Smith, his father, the son of Isaac Smith, was a native of Canterbury, N. H., and married Mary E., daughter of Nathaniel Smith. Her mother, *née* Susannah Bartlett, of North Brookfield, is still living at the age of ninety-seven years.

At the close of his long service in the army Lieutenant Smith returned to North Brookfield, and in September, 1866, he came to Worcester, and engaged as a traveling salesman with the well-known boot and shoe firm of S. R. Heywood & Co., manufacturers and jobbers. In 1870 he became a partner, succeeding to the jobbing business of S. R. Heywood & Co., under the firm-name of A. J. Stearns & Co.

Later the business of this firm was consolidated with that of B. W. Childs & Co. (1874), under the name of Childs, Smith & Co., the present firm, in which he is a partner. The house does a large and successful jobbing business throughout the New England and Middle States in the general line of boots, shoes and rubbers.

Colonel Smith married Abigail C., daughter of Benjamin Nevin, of Ogsdenburg, N. Y., December 8, 1868, who died June 28, 1880, leaving three children,—two sons and a daughter. His second wife was Mary C. Wilson, of Worcester, whom he married April 26, 1882, and by whom he has two sons.

In politics he is a Republican, active, but not aggressive, preserving in all the relations of life the same manly and genial traits which have won him the respect and regard of his comrades in the army and a host of warm friends in business, military and social circles wherever he is known.

#### RANSOM C. TAYLOR.

Ransom C. Taylor, of Worcester, Mass., was born in Winchester, N. H., February 24, 1829. He is a son of Charles Taylor, of Winchester, and is the sixth of nine children. His mother's maiden name was Susan Butler, a daughter of an old citizen of Winchester, where the ancestors of both of his parents had lived for several generations. When Ransom was four years old, in 1833, his parents removed to Northbridge, Mass. There, when of sufficient age, he attended the common-schools of the village and assisted his father on his farm and in the meat business, in which his father was engaged.

At the age of twelve years he drove his father's meat-cart through the neighboring villages, carrying out meat.

When he was seventeen years old he left home, and began business for his father in Worcester, manufacturing neats-foot oil, glue-stock and tallow, and dressing tripe for the market. He had been in the city only a short time when he had the typhoid fever, and was obliged to return home to rest and regain his health. The next year, being then eighteen years of age, he bought his time of his father for three hundred dollars, and went to Sutton, Mass., where he engaged in business similar to that of his father on his own account. He remained in business there four years. In 1850 he married Miss Mary Louisa Chase, an accomplished and excellent daughter of Capt. Abraham Chase, of that town. At the age of twenty-two he removed to Worcester, where he has since resided, carrying on for several years the same business that he had followed before.

His business grew to be the largest of its kind in this part of the country. Besides his establishment in Worcester, he had branches in New York City, Milford, Randolph, Taunton, Springfield, Hartford,

*Ransom C. Taylor*

New Haven, Troy, Albany and other places. When he began business he employed only two men and used two horses, but his trade increased so much that at one time he required one hundred men and as many horses. While thus engaged in business he began investing in real estate, and after he had been in Worcester about twenty years he disposed of his extensive business before-mentioned, and turned his whole attention to transactions in real estate.

His first purchase was the Newton estate on Front Street, now owned by Dr. F. H. Kelley. Much of his capital is invested in large buildings in the centre of the city, especially on Front and Main Streets; among the best known being the Taylor building, the First National Bank building and the Chase building, all of which are ornamental to the city. He built the first five-story, six-story and seven-story blocks in Worcester. Mr. Taylor was one of the originators of the First National Bank and was one of the directors of that corporation for about twenty years. He was also one of the original stockholders of the First National Fire Insurance Company, of which he has been a director and large stockholder ever since.

Mr. Taylor's wife died in the year 1878. In 1880 he married Mary S. Stevens, daughter of Merrick R. Stevens, a flour merchant of Newton, Massachusetts. He has four children by his first wife—two sons and two daughters; and by his second wife a son and a daughter. The two older sons are associated with him in business. Until 1883 Mr. Taylor lived at Quinsigamond Village, where he had built for himself a large and handsome house, but in that year he purchased the Dr. Kelley mansion, on Main Street, where he now resides.

When he came to Worcester the population of the city was about seventeen thousand. He has been identified with its growth until the present time, it being now a city of eighty thousand inhabitants. He has never sought office, and with the exception of two years, when he was a member of the Board of Aldermen of the city of Worcester, has not held public office. He is positive in his political views, but has not been a very active politician. He does, however, take an active part in local affairs in the city, and was a contributor to the fund recently raised to procure the new location for the post-office in the city. It was largely owing to his influence that the new site for it was selected. He is a lover of fine horses and enjoys driving his speedy and handsome teams.

Mr. Taylor is a conspicuous example of what may be accomplished in New England by energy, industry, economy and perseverance. Starting in life without the advantages of education, except such as he obtained in the ordinary public schools in the small village where he was reared, he early manifested that aptness for business which gave assurance of success. He early acquired confidence in his own judgment as to business enterprises, and he possessed the courage

to enlarge his business and extend his field of operations, and thus greatly increase his profits.

His operations in real estate have been large and equally successful. His purchases were followed by an advance in the market value of the estates purchased. These continued successes of his various branches of business have raised him from a poor boy to be one of the most wealthy men in the city. Popular rumor classes him among the millionaires. His success under difficulties is proof of his sagacity and the soundness of his judgment.

Possessing an accurate and retentive memory, he has been able constantly to carry in mind his numerous business transactions without much trouble of making entries on books—an advantage easily appreciated.

He is eminently a self-made man. It may be said of him in the words of Shakespeare, "Not propt by ancestry, neither allied to eminent assistants, by the force of his own merits he makes his way." Until quite recently Mr. Taylor was an attendant at the Plymouth Congregational Church in Worcester, and has been a liberal contributor to its support. He has also contributed in aid of the Whitinsville Methodist Church. His father was a prominent Methodist and contributed largely to aid in the building of a Methodist church in Winchester.

---

#### JAMES ANTHONY COLVIN.

Mr. Colvin was born in Cranston, R. I., on the 20th of June, 1833. His father's name was Caleb Colvin, and he was a descendant from John Colvin, who settled in Rhode Island near the close of the seventeenth century.

The education of Mr. Colvin was gained at the common school, where his quickness of apprehension and application as a scholar made him proficient in the limited studies of such schools at that period. But whatever deficiencies existed at the time he left school were soon supplied as he went out into the world; so that now few men, aside from those who are in what is called professional life and actual students of the times, stand before him for general intelligence, and that shrewd use of knowledge that always leads to success. But the success attained by Mr. Colvin is by no means to be attributed solely to shrewdness and industry, but in a large measure to that unswerving integrity of character and manliness that have all along marked his course.

Mr. Colvin's first experience in the work of life was on the home-farm at Cranston. There he labored till eighteen years of age, when he left to learn the iron foundry business, and soon became so skillful that in 1863 he was able to commence business on his own account, which he did with his brother Caleb as a partner at Danielsonville, Conn. In about two and a half years after this commencement he purchased his brother's interest and continued on for some two

and a half years more, when his establishment was burned. Though crippled by this disaster, he was far from being discouraged; and after duly considering the matter, determined on removing to Worcester as affording a more extensive field for contemplated future operation. Thus he became a resident of Worcester in 1868. In the business here he again formed a partnership with his brother, a partnership which continued twelve years. After that period James A. Colvin, the subject of this sketch, commenced on his sole account, and has continued to conduct a large and prosperous business to the present time. The reputation of the products of his foundry in the markets of the country is second to none; but the excellence of his products is not the only element of thrift, for his promptness and fair dealing have had their deserved influence. But the writer of this sketch has received a caution from Mr. Colvin not to give a word of undeserved praise—a caution which he feels bound to respect, though perhaps it was unnecessary, as he would not knowingly, in any case, bestow unmerited adulation, nor, especially, undeserved censure.

In public affairs Mr. Colvin has never been conspicuous, preferring rather the quiet duties and enjoyments of home life when not engrossed by the cares of business. He is a reader of good books, historical, biographical and similar works, seldom wasting time over the ephemeral literature that at this day falls in such showers from the press, and which is so repugnant to the taste that is disciplined for the useful and dignified.

In his religious views Mr. Colvin ranks with those now commonly known as liberal, in distinction from those of the old Puritanical and Trinitarian theology. And in politics he holds allegiance to the principles of the present Republican party.

Mr. Colvin has been twice married. His first wife was Amy Ann, a daughter of John C. Johnson, of Natick, R. I., the marriage taking place January 21, 1854. His second wife was Anna, a daughter of Francis Lee, of Montpelier, Vt., the marriage taking place January 20, 1869. By his first wife he had two sons and one daughter; and by his second wife he had two daughters, all of whom are now living.

---

WILLIAM HENRY SAWYER.

It would be unseemly, even were it proper, in a work like that now in hand, to indulge in personal comparisons; to show wherein this or that one is superior or inferior to some other. Such comparisons, of all others, are odious. But it is not invidious to remark of one possessing the characteristics of the individual whose name appears above, that he stands in the front rank of Worcester's most active, enterprising and successful citizens.

Mr. Sawyer is a native of Bath, N. H., and was born August 8, 1843. Like so many of the smart sons of New England, who, from humble conditions,

have attained high positions in the business world, his education was gained chiefly in the common school, though he was for a while a pupil in the Newbury (Vermont) Seminary. Yet he by no means came from the humblest rank, for his father was a well-to-do farmer, and the owner of many lumber producing acres, in laboring upon which the son commenced that course of training which finally led to the high position in the lumber business he now occupies, a position the most commanding of any in the trade now in Worcester, if not in all New England. The following statements found in an interesting and valuable little work published in 1888 by F. S. Blanchard & Co., of Worcester, in the form of an almanac and county-hand book, give in a succinct form a view of Mr. Sawyer's progress in the lumber business: When he had attained his majority, "he and his brother started the lumbering business for themselves, building a saw-mill, from which they turned out products for quick shipment to the cities. This was followed for several years and then, after visiting several cities to decide upon a location for establishing a retail lumber trade, William H. came to Worcester in 1870, and formed a partnership with Mr. Joseph Chamberlain in the lumber-yard on Grove street. He retired from the firm at the end of the first year and started for himself on Lincoln street." And he seems to have located on the very spot where the first business of the kind was started, in 1685, by Capt. John Wing. He was successful beyond expectation. "But it is not as a retailer of lumber that Mr. Sawyer has accumulated his handsome fortune. He early foresaw the advantages of handling on a large scale the lumber from the great forests of Michigan and Wisconsin, and the pine centres of Canada, and in 1877 established a wholesale lumber-yard at Tonawanda, New York, a few miles from Buffalo, and in 1880 established another yard at Bay City, Michigan. He also went into the forests of Tennessee and Kentucky for white wood, and into other Southern States for black walnut, shipping the products to the Middle and Eastern States. He was one of the first to ship white wood from Tennessee to Massachusetts. He did an immense business when the prices of lumber were high, and he reaped the benefit of his industry. He has consolidated his Bay City yard with that of Tonawanda, which has a capacity for thirty million feet of lumber, and employs one hundred men, all lumbering."

Mr. Sawyer enjoys an enviable reputation for honesty and fair dealing, as well as for readiness to lend a helping hand in all approved enterprises. And his abundant means enable him to indulge his natural inclination to liberality in aid of the worthy objects of charity so constantly presented. In the furtherance of missionary work he is especially interested. But he is not one to make an ostentatious display or obtrusive boast of his good deeds.

It is remarkable that in all his business career he

W. H. Sawyer

*J. M. Bassett*

seems never to have entered into an undertaking that was not successful—at least where he had a controlling influence; a fact which will naturally be attributed to his uncommon shrewdness, forecast and energy. Another element of success has been his habitual reticence concerning his business affairs. Still another, and, without doubt, one of the chief elements of success, is his promptness in meeting appointments and obligations of every kind. He is not one to put off till to-morrow a duty that can as well be done to-day, in this differing from a great many business men who allow that arrant thief—procrastination—to steal so much of their substance.<sup>1</sup>

In public life, at least so far as official position is concerned, Mr. Sawyer has not been conspicuous, his inclinations never leading in that direction. He, however, accepted the office of Alderman of Worcester, and now, 1888, occupies a seat with that honorable board.

A good part of his few vacant intervals of time he spends in reading, and keeps well posted on the current events of the day. In historical researches he delights, and in books of permanent usefulness. But novels and similar light literature he eschews. He is accustomed to spend, as far as other duties will allow, his evening hours at home in reading and fire-side recreation, seldom appearing in the club room or other outside place of entertainment.

Mr. Sawyer has been twice married. His first wife, with whom he was united January 4, 1870, was Miss Sylvia T. Child, of Bath, N. H., a lady belonging to one of the leading New Hampshire families. He had a daughter by her, and both mother and daughter died in 1872. His second and present wife was Miss Fanny A. Weld, an intelligent and estimable lady. Their marriage took place in May, 1874, and the fruit of this second union is four daughters and one son, all of whom are now living.

In his religious views Mr. Sawyer ranks with the Trinitarian Congregationalists, in that respect adhering to the old paths of the New England fathers. In politics he is a pronounced adherent of the Republican party.

<sup>1</sup> The writer is aware that the Websterian doctrine teaches the contrary, that is, never to do to-day what can be put off till to-morrow. The late John Glen King, of Salem, who was a personal friend as well as legal brother of Hon. Daniel Webster, many years ago related to the writer a scene which took place in one of the higher courts. Mr. Webster was counsel in an important case, and when it was called he arose in all his dignity, and much to the surprise of all, moved for a continuance. "Why, Mr. Webster," said the Judge, "for what reason do you make such a motion? The parties, witnesses and council are all here, ready to go on. I am surprised at your motion, and must ask for some substantial reason. The homely old maxim, 'Never put off till to-morrow what can be done to-day,' is a good one and worthy of application in this case." Upon that Mr. Webster, in his most solemn and measured tones, thanked the court for reminding him of the maxim, that was at least venerable for its years, but begged leave to remark, that wise as it appeared he was accustomed to follow one that seemed better fitted to his own habits, and that was, never to do to-day what could be put off till to-morrow. "Well, well," Mr. Webster, replied the Judge, "the Court and bar will never doubt that you have faithfully followed the teaching of your maxim. The case must go on."

#### JOSEPH MASSA BASSETT.

Mr. Bassett was born in Eden, Vt., on the 31st of August, 1834, and was a son of George Bassett, a farmer of that place. His education was obtained in the common school of that period, in which, if there were not such a variety of studies pursued as is the case at this day, elementary instruction was given with a thoroughness not now excelled.

From the time he was able to make his services of value, till the age of sixteen, he led the life of a farmer-boy, and in that capacity secured the benefits of one of the most healthful and freedom-inspiring of all employments.

In April, 1851, when but sixteen years of age, he came to Worcester, and found employment in the manufacturing establishment then known as Court Mills for about six months, until compelled by failing health to return to his country home. After a few months, his health having been restored, he entered a country store, where, for two years, by dealing in all sorts of merchandise and with all sorts of people, he gathered an experience that in after years, as he entered upon a more extended and complicated business career, proved of very great advantage. Few situations are better calculated to develop the business capacity of a youth than a New England country store. The dilapidated little shop in old Danvers where the celebrated London banker, George Peabody, began his business life was lately to be seen, if it is not still grimly smiling there.

In March, 1854, Mr. Bassett again came to Worcester as an incipient adventurer in trade, and from that time Worcester has been his home. His first employment was in a lumber yard, where he remained for a year. After that, for eight years, he was bookkeeper in a manufactory of woolen machinery. His next step was to become a partner in the old firm of E. C. Cleveland & Co. At the end of four years he disposed of his interest to Mr. Cleveland, and for a year was in the wool business, with a partner, under the firm-name of Bassett & Hobbs. He then returned to his old business of manufacturing woolen machinery, and again formed a partnership with Mr. Cleveland, the style of the firm being Cleveland & Bassett. The firm met with difficulties and losses to such an extent that in about two years a failure took place.

It was in July, 1870, that the firm of Johnson & Bassett was formed, and pursued the manufacture of wool-spinning machinery. The partnership continued till the death of Mr. Johnson, in March, 1880. Mr. Bassett then purchased from the heirs of his late partner their interest, and has continued the business to the present time. Under his sole management it has become extensive and profitable.

From this brief sketch of the business career of Mr. Bassett it will be seen that he has had his share of ups and downs. But early hardships and later reverses have not discouraged him, and at the present time he is reckoned among the many prosperous and substan-

tial men of whom Worcester has reason to be so justly proud—men who, by their various industries are daily adding to her wealth, and extending her credit and good name.

But Mr. Bassett has not been through life so absorbed in business as to forego the advantages and deny himself the pleasures of travel. Not only has he visited nearly all the important cities and places of special interest in our own country and Mexico, but in the far north of Europe has witnessed the wonderful spectacle of the midnight sun, and in the famous cities of other quarters of that continent has seen the triumphs of art and the varied phases of social life.

Mr. Bassett is not a politician, as the term is usually applied, but has decided opinions, and is not backward in expressing them. He is a strong Republican and accepts in full the doctrines they advocate. He has not been an office-holder to any great extent, though for six years he served as a member of the School Board, a position he cheerfully accepted for the opportunities it afforded to do something for the advancement of education among all classes; and his efforts in the office won the approbation of those who placed him in the situation where so much good could be accomplished.

On the 16th of April, 1857, Mr. Bassett was united in marriage with Elizabeth Kennan, of Vermont, and five children have been born to them—three sons and two daughters—but of the children only two sons are now living.

Mr. Bassett is still in healthful and active life, and there is good ground for hope that he may live for many years, by his ingenuity and accumulating skill, by his vigor and enterprise, adding more and more to the already famous industrial specialities of good old Worcester.

#### IVER JOHNSON.

Worcester has been noted for the character and ability of its prominent business men, especially in the manufacturing industries. The men who led in the transformation of the sleepy country village into the bustling growing city, were the foremost in courage, enterprise and sagacity. Early in the history of the city men often said where are we to look for successors to the Washburns and Wheelers of the generation then passing away? But they were answered with such names as Crompton, Walker, Moen, Knowles and many others, men who have even exceeded in achievements the leading actors in the earlier generations. Indications are not wanting that we are still evolving from the new generation of business men captains of industry with the spirit and energy of the great ones gone before.

Of this new generation, and notable in it in many ways, is the subject of this sketch. Mr. Johnson was born in Nordfjord, Norway, February, 14, 1841. His father was John Johnson, a farmer, one of a line of Johnsons reaching back for a thousand years, who

from father to son, handed down the some narrow acres on which they had lived and died. But Iver was not exactly "a chip of the old block." His ambition reached out beyond his meagre surroundings, and at the age of sixteen he left home to serve as an apprentice at gun making in Bergen. His only opportunity for education had been the parish school for three months of the year, but this was afterward supplemented by the instruction received in Sunday-schools, institutions which in Norway combine secular with religious teaching. His life in Bergen was a hard one, with longer hours of labor than were ever known in this country for mechanical work. Toil from 5 A.M. to 9 P.M. in summer, and from 6 A.M. to 8 P.M. in winter, was a great tax on human endurance. But as it was then the common lot of the toiler nothing better was expected, and it was borne uncomplainingly.

In 1862, having finished his apprenticeship, Mr. Johnson went to work at his trade in Christiania. Here he remained but one year. The fame of the newer land beyond the seas, with its wonderful possibilities had reached the ears of the young mechanic, and in 1863, at the age of twenty-two, he emigrated to America, and located in Worcester. He was of the vanguard of the great army of Scandinavians which has since been moving across the borders of the land which recent historical research has proved their ancestors discovered.

If in number like an army, in no other respect does the likeness hold, for they came to build up, not to destroy. Their power is felt in increased material wealth and in moral example. "Purer manners, better laws" must inevitably result from the infusion of this wholesome Northern blood into the arteries of the national life. He came at a time when the country was engaged in the deadly struggle of the Rebellion, but found no difficulty in getting work at his trade, and to it he devoted himself assiduously for the next eight years. His opportunity had come and he knew how to improve it.

In 1871, with the small savings of industry and economy, he, in company with Martin Bye, hired a small room on Church Street, and began the manufacture of pistols under the firm-name of Johnson, Bye & Co. From this small beginning grew the great business which has since, in busy times, employed three hundred and fifty hands. In 1873 the firm had so outgrown its accommodations as to necessitate removal to the building on Central Street, known to old residents as the "Armsby Building," then owned by H. H. Bigelow. They took two rooms and employed about fifty hands. In 1875 they bought the building, and, as the business continued to grow, took room after room, until, in 1881, they occupied the whole of the building. In 1883 Mr. Johnson bought the interest of Mr. Bye, and the business has since been conducted by him under the firm-name of Iver Johnson & Co.

*Wm. H. Burr*

He now manufactures single-barrel breech-loading shot-guns—top, side and hammerless-action; revolvers—single, double and hammerless-action; single-barrel pistols, air-guns, police goods, handcuffs, leg-irons, balls and chains, police hooks, chain twist-ers, iron plates (for carpenter's use), and bicycles, most all under his own patents. He also does drop-forging of all kinds, polishing and nickel-plating. The firm have made many improvements on their goods, and have built many new machines for their manufacture. Mr. Johnson devotes himself closely to his business, yet he finds time to take considerable part in public affairs, and to meet all the requirements of a public-spirited citizen. He is an intelligent student of social and economic questions. He has been for many years a director in the Sovereigns' Co-operative Store, and on the board of directors of each of the three Co-operative Banks of Worcester, since their organization, being the president of one of them.

To the duties of these positions he devotes himself with conscientious fidelity. Such time as he can spare from his exacting business is always at their service, and his advice on all questions relating to the conduct of their affairs is given great weight by his associates.

Mr. Johnson was married in 1869, and has four children. He lives in a comfortable home, which he built for himself some years since, on Catharine and Channing Streets. In 1884 he made a business and pleasure trip across the water, visiting his old home and many of the manufacturing centres on the Continent and in England. Those who have heard him describe what he saw and experienced on his trip, have no doubt that he returned with strengthened regard for the land of his adoption. Recently he was of a committee of manufacturers who testified in relation to tariff legislation before the Finance Committee of the National Senate. Endowed with an active mind and healthy bodily powers, he has great capacity for achievement, and will unquestionably accomplish even more substantial results than have already attended his efforts.

---

WILLIAM HENRY BURNS.

Mr. Burns was born in Charlestown, on the historical summit known as Bunker Hill, on the 22d of June, 1856, and was a son of James Munroe and Catharine Marston Burns. The family is of Scottish ancestry, the American head having come over as early as 1642, settling in Haverhill, then a new and exposed frontier station.

While the subject of this sketch was yet young the family removed to Somerville, and his education was commenced in the common schools of that place. He afterwards attended the Lowell Grammar and High Schools, and subsequently took a regular business course in Bryant & Stratton's Business College in Boston. He was likewise a graduate of the State

Normal School at Bridgewater, and fitted for college, but relinquished the purpose of taking a college course, being urged to at once enter the profession of teacher. He went to Spencer and took charge of a district school for the winter and spring terms of 1878-79, and then accepted the situation of principal of a grammar school, and held it till the summer of 1881. When he took the cars for Spencer his pecuniary means were at a rather low ebb for an enterprising young man, being just \$3.25. But he had what was of more value than many times that amount of money,—a laudable ambition and unyielding resolution.

It was towards the close of the latter year that he abandoned teaching and commenced that business career for which he was so well suited and in which he has been so eminently successful, his first employment being the selling of goods for an underwear house in Boston.

After spending two and a half years as a traveling salesman, with Mr. John S. Baker, another in the same line of traffic, he conceived the idea of settling in Worcester and starting a small factory for the manufacture of underwear. The idea was put in force, but for six or eight months they were subjected to much hard work and many anxieties. In 1884 the partnership connection with Mr. Baker was severed, and Mr. Burns, continuing the business, employed him to sell the goods in New York and the West. The business so increased that in three years offices were opened in Boston, New York and Chicago, with a sales-agent in each place. From 1883 to 1887 it was found necessary to increase the factory floor-space from four thousand to twenty-eight thousand feet, and still more was soon found necessary. In 1887 Mr. Harry S. Green, a brother-in-law of Mr. Burns, received an interest in the business. At the present time, January, 1889, the business has attained such magnitude that Mr. Burns has lately erected near the centre of the city a very large five-story brick and stone building, which will give an acre and a quarter of flooring for their own operations, besides three large stores on the ground-floor, which are designed for wholesale business. They are to remove their business to the new and capacious quarters in July next, that month usually being the dull-est for business, and hence the most favorable for the interruption of removal.

It need not be repeated that the business of the firm is the manufacture of ladies' and children's underwear. At the present time they employ four hundred hands, and their goods are sold all over the United States. They cut up, last year, over two millions of yards of cloth and millions of yards of embroidery and lace. Their daily capacity is about five hundred dozens of made-up goods, or six thousand pieces. Competition being sharp, they are, of course, obliged to take advantage of every facility that economy can dictate. Their raw material they procure

from first hands; have their own cloths made, and import their laces and embroideries, thus taking every means to put their goods on the market at the lowest possible prices. They largely employ female help, thus furnishing remunerative employment for many who would otherwise be doomed to indigent idleness. One great aid to his success Mr. Burns considers his liberality in advertising. He spends thousands of dollars annually in keeping his name and his business before the public. And another, and certainly not less potent element, is his honest and unswerving determination to always give his customers their money's worth.

Mr. Burns has not been much in public life, his time and energies having been almost exclusively devoted to business. In his religious views he is firmly established, being of the old Trinitarian order; is a great respecter of the Sabbath and a devotional attendant on public worship.

In politics he is a pronounced Republican, though not blinded by party zeal. He is likewise a strong temperance man, and always found liberal in contributing towards every commendable object of reform and every beneficial enterprise.

Mr. Burns was united in marriage, November 21, 1882, with Annie F., daughter of Henry R. Green, of Spencer. The fruit of the union is two sons,—Arthur Henry and William Russell.

Of the early struggles of Mr. Burns, perhaps a word or two may be added to what has already been said. His mother died in 1869, when he was twelve years of age, and the family were then in rather depressed circumstances. There were five children. From the time of his mother's death he was obliged substantially to provide for himself, as his father was in poor health and died two years later, working by day and studying by night. He was, however, assisted in gaining his education by an aunt. At the age of fourteen he was working for his board and clothes and winter schooling, and at the age of fifteen he received four dollars a month in addition. At the age of sixteen he received fifteen dollars a month and board. From this it will be seen with what phenomenal rapidity he progressed, as he now ranks among the most prominent manufacturers, not only of industrial Worcester, but of the whole country. To what is such success to be attributed? Of course much is referred to boldness in venture, activity and enterprise; and something, perhaps, to what goes by the name of good-luck. But other and higher agencies have operated—such agencies as are to be found in integrity of character, in fair dealing and in the faithful exercise of the manifold obligations due from man to man. The good instructions and sound principles instilled into his young mind by his pious mother have borne their legitimate fruit. And surely no well-ordered mind can envy the prosperity of a man like him; but, on the contrary, feel that in him they have an exemplar worthy of imitation.

#### GEORGE CLARKSON WHITNEY.

We learn from high authority that "An honest tale speeds best being plainly told." We add, on our own responsibility, that the sum of a well-spent life is not reckoned by years.

George C. Whitney has not yet reached the veteran stage, as his portrait in this volume will attest, and though the hand of Time has dealt gently with him, he has also been "good to himself," as the phrase runs, having practiced life-long habits of temperance and right living.

In the business circles of Worcester he ranks among the young, active and successful forces of to-day, and enjoys many well-deserved marks of public esteem and confidence.

George Clarkson Whitney was born in Westminster, Mass., September 19, 1842. His father, John Whitney, was a native of Westminster, as was also his grandfather, John Whitney, born October 12, 1769. His great-grandfather, Nathan Whitney, born in England, March 12, 1727, came from England to Waltham, Mass., early in life, and later settled in Westminster. Nathan held a commission as captain under King George III., but resigned just before the War of 1774-78, and became an ardent patriot. During the winter of 1776 he had charge of a squad of Dutch (British) prisoners, who were quartered for the season in the old homestead in Westminster.

On the maternal side the ancestry runs back to both the historic families of Ethan Allen and Gen. Warren, of Revolutionary fame. Lydia Allen, the wife of John Whitney and mother of George C., born in Hubbardston September 14, 1802, was the granddaughter of Ephraim Allen, born in Rutland 1763, who married Lydia Warren, also of Rutland, and removed to Hubbardston.

The subject of this sketch was educated in the district schools of Westminster until fifteen years of age, and then came to Worcester in 1855 and attended the public schools until admitted to the Worcester Academy in 1856. He enlisted as a private in Company F, Captain John Baldwin, of the Fifty-first Regiment Massachusetts Volunteers, Col. A. B. R. Sprague, and served a part of the time as clerk in the provost marshal's office, under Major Harkness, at Beaufort, N. C., and was honorably discharged at the expiration of his term of service. The regiment was in active service in Virginia and North Carolina.

In 1866 he began business in a small way at 393 Main Street, paying twelve dollars a month rental for a single back-room, where he carried on the manufacture of fancy stationery and lace valentines, from imported stock. Three years later he bought the stock and good-will of Messrs. Berlin & Jones, the largest manufacturers in this line in New York, and removed the whole business to Worcester. These branches have since been continued and greatly enlarged, but about 1876 he began to add Christmas cards, books and booklets, until this publishing branch

has grown to much larger proportions than the original lines. The house now employs from one hundred to one hundred and twenty workmen and women, and has its own departments for printing, box-making and shipping, besides the designing and manufacture of the artistic features of the various publications, by skilled workmen. The product is sold direct to jobbers in all parts of the Union, employing six traveling salesmen, with branch offices at Chicago, New York and Boston.

Besides these business activities, Mr. Whitney has also found time and enthusiasm for much private and public usefulness and philanthropy in the exercise of higher aims in life than mere money-getting. He united with the First Baptist Church of Worcester in June, 1865, and has been the superintendent of its Sabbath-school since 1871.

He has been an active member of the Young Men's Christian Association since 1864, and president of that organization in this city for four years—1872 and '73, and 1885 and '86. As a member of the soliciting committee to raise funds for the present new and costly edifice, he rendered zealous and intelligent service, and is an earnest promoter of the work of this association.

He also served as a member of the International Sunday-school Committee from 1879 to '83, on the

State Executive Committee of the Young Men's Christian Association from 1876 to '83 and is a charter member of the Worcester Baptist City Mission Board, and has been its president since 1886.

In the department of education he has, for ten years, been a trustee of the Worcester Academy, is the secretary of the board and a member of the Executive and Investment Committees.

Always a straight Republican, of strong anti-saloon, no-license convictions, he has been modestly, but earnestly identified with the cause of temperance reform, both as a citizen and a member of the city government. He was in the City Council in 1883 and '84, and was elected to the Board of Aldermen from Ward 8 for 1888 and '89. He is a trustee of the City Hospital, and for several years has been a trustee of the Home for Aged Women.

George Clarkson Whitney was married, in 1870, to Amy Ellen Whidden, born in Calais, Me., May 22, 1846, the daughter of Hon. Chas. R. Whidden, born in St. George, New Brunswick, May 22, 1822, the son of General Rendol Whidden. Her mother was Mila Frances Smith (Whidden), daughter of Hon. Noah Smith, of Providence, R. I. They have three children—Mila Frances, born April 6, 1871; Florence Allen, born September 4, 1878; and Warren Appleton, born April 16, 1883.

"WILLOW PARK," WORCESTER.

TO THE ANCIENT WILLOW.

1.

Streams from earth's most sacred place,  
Poured at Oread's rocky base,  
Filled thee with the vital force  
Of the planet's deathless course  
Ages gone, till thou hadst grown  
And made the upper skies thine own.  
And still thy tender vernal shoots  
Take the thrill those eager roots  
Feel, deep hidden from the sun,  
Where those crystal sluices run.

2.

Who thy mystic rede shall spell,  
Who thy generations tell?  
Haply in the open glade  
The lover of some dusky maid  
Cast thee once, a supple wand,  
O'er thee since what days have dawned,  
What innumerable hours  
White with storm and grey with showers,  
Mornings bursting rosy bars,  
Purple evenings sown with stars!

3.

Long ago, from ambush sprung,  
Through thy depths the war-whoop rung!  
Awful lights about thee blazed  
When the braves their war-song raised!  
Round thee curled white clouds of fleece  
When they smoked their pipe of peace!  
Cobwebs in the vanished gleam,  
Less than shadows of a dream,  
Even their dust is blown away,—  
Thou and thy green branches stay!

4.

Thou hadst known how many springs  
Of building birds and darting wings  
When thy great tops caught the fires  
Of Freedom's sunrise, and our sires  
For a cause that was the Lord's  
Turned their sickles into swords!  
Thou hast seen those conquering men  
Beat their swords to ploughshares then,  
And the hamlet in its health  
Grow a mighty commonwealth!

5.

Rent was all thy ancient mail,  
Familiar of the winter gale,  
That night the bell-tower's wild alarms  
Called a nation into arms,  
And trembling to the squadrons' tread  
Earth made ready for her dead.  
Torn and twisted, gnarled, yet green,  
Living ruin, thou hast seen  
Empire from sea to sea complete  
And History pausing at thy feet.

6.

Alas, alas, we come and go,  
And still thy yellow tassels blow,  
Still shall thy quickening reddening sprays  
Be first to promise genial days  
Of April, with her bright face wet,  
And the remembered violet.  
Still shalt thou toss thee grey and hoar  
When ruffling winds across thee soar  
In thy undying life, while we  
Fall like thy leaves, old Willow Tree!

HARRIET PRESCOTT SPOFFORD.

## APPENDIX.

### BERLIN.

**BUSINESS MEN.**—Our first young man who made a business success was Abraham Babcock, son of William, born 1770. He was a tobacconist in Boston. He died in mid-life.

Levi Meriam, son of Levi, born 1781, settled in Boston in the wholesale wine trade 1812. He died 1831. His annual family visit to the old homestead and his "turn out" were quite impressive on his native town, which held him in high esteem.

William Addison Howe, son of Solomon and Sarah (Stowe) Howe, both of Marlboro', was born in Berlin July 4, 1806. He was inherently a "business man." The "heredity" was probably of the Stowe blood. His father was a country merchant—groceries, hardware, hats, cotton cloth, calicoes and broadcloth. Young Howe at sixteen bought and sold on his own judgment. A "tavern" was run in connection. The father died at the son's majority; the mother soon after. He kept the family of five in home life till his location in Boston as a wholesale dry goods merchant at thirty-one years of age. This ability had come of his own hand in a country store in a town of six hundred inhabitants. He took a younger brother from the farm and made of him also a Boston merchant. Acquiring reputation as a business man, he left the store to his brother and a partner, and took the presidency of the Eliot Fire Insurance Company, which soon had an established reputation. In connection he was also elected president of the Eliot Bank. These offices he held till stricken by paralysis, in 1858. His life was prolonged till the 1st of October, 1863. His years of feebleness were spent upon the homestead, which he had sacredly kept. He never married. His last days, though clouded, were enjoyable. His ambition for wealth (he had a competence) was never half so intense as was his desire to stand among the successful business men of Boston. This was the pride of his life.

Solomon Henry Howe, brother to William A., was born November 29, 1822. Reared in the country, he entered his brother's store in 1839. He early developed aptitude for mercantile life; became partner in his brother's firm and pressed business to a large extent. On his brother's retirement he entered into a partnership—Pierce, Howe & Co. (William P. Pierce); later as Howe, Pierce & Co., with a younger Pierce

brother. The elder Pierce said that S. H. Howe was the best salesman in Boston. Later he was silent partner in the house organized of his own clerks—Jackson, Mandel & Co. Mr. Howe retired with competence of wealth to a fine farm on Wataquodock Hill in Bolton. He adorned his home and improved his farm; was prominent in the New England and the Worcester County Agricultural Societies; was president of the latter. He held various trusts in the town. But his life had been too stirring for the country and leisure. He was persuaded into connection with the B. C. & F. R. R. He was president when the road was extended to New Bedford. The road came to grief and Mr. Howe lost most of his well-earned wealth. But his buoyant nature carried him through the struggle. He was just getting free of legal complications when, February 5, 1879, he was smitten by the family hereditary disease, paralysis, of which his mother, brother and two sisters also died. Mr. Howe was a very genial and most popular man in all the relations of life. He married, 1851, Lucinda, daughter of James Savage, Esq., of Boston, then of Southboro'. He left one daughter, Mrs. Leslie Hastings, of Cambridge; three sons—Solomon H., commission agent, New York City; Doctor James S., of Boston; William Addison, of Oregon. He represented his district in the House 1875.

Stephen Sawyer, native of Berlin, has his record in this work among the business men of Worcester.

---

### NEW BRAINTREE.

A partial list of the soldiers in the French War (1755-60), in the regular army for one or more campaigns, contains the names of Edward Blair and Thomas Barnes, corporals; Oliver Cobleigh, Joseph Gilbert and Pelatiah Ware, privates.

The following enlisted for a shorter term of service: Samuel Steele and Joseph Higgins, corporals; Eliphalet Ayers, David Barr, Edward Blair, Solomon Gilbert, Samuel Harrington, Sylvanus Howe, Aaron Forbush, Thomas Weeks, Asa Whitcomb, privates. John Peacock was adjutant in Col. Timothy Ruggles' regiment in the same war.

The following is a muster-roll of Capt. Grainger's company of minute-men that left New Braintree for Boston on the afternoon of April 19, 1775: John

Grainger, captain; Joseph Barnes, lieutenant; Joseph Bowman, ensign; Samuel Warner, Jonathan Nye, Samuel Joslyn, Jesse Ware, sergeants; John Adams, Joseph Johnson, Solomon Goodail, Jonathan Wetherell, corporals; Elias Hall, Jonathan Stone, Wyman Hoit, William Shaw, Edward Hunter, Mathew Fenton, Cornelius Cannon, John Hunter, James Weston, Hue McCally, Robert Hoit, Robert Rickey, William Steele, Joseph Thurston, William Dickey, David Woods, John Ears, George Woods, Samuel Woods, John Nye, William Holmes, John Woods, Joshua Bowman, Francis Stone, Robert Hunter, Parkman Bradshaw, Moses Hambleton, Thomas Man, Hezekiah Hancock, Oliver Ware, Joseph Rogers, Joseph Ayrs, Daniel Corthel, privates.

A muster-roll of the company under command of Captain Grainger, in Colonel Learned's regiment, August 1, 1775, contains the following from New Braintree: John Grainger, captain; Elias Hall, ensign; Jonathan Stone and Jonathan Wetherell, sergeants; Wyman Hoit, corporal; David Hunter, fifer; Benson Dunbar, drummer, and the following privates: Jonathan Loud, Daniel Corthell, Oliver Ware, Lovel Lincoln, Joslin Munroe, Samuel Shaw, James Weston, Robert Rickey, David Wood, Joseph Steele, William Shaw, Nathaniel Vinton, Pelatiah Hawes, Joseph Hale, Cornelius Cannon, Hugh McCally, William Steele, John Eyres, Isaac Amsden, Edward Hunter, William Johnson, John Sprague, Timothy Howe, John Hunter, Robert Hoit, William Dickey, Darius Barr. Average term of service, three months, one week and six days.

The following is a list of the soldiers in the Revolutionary War in Captain Dexter's company of Colonel Learned's regiment (term of service, six months): David Bennet, lieutenant; Jacob Gilbert, corporal; Phineas Warner, Samuel Shaw, Oliver Woolcott, Joseph Swinerton, Jacob Nichols, Salathiel Washburn, Philip Delano, Oliver Stone, Aaron Hall, James Stine, Jr., Alexander Dun, James Richmond, Elijah Weston and Joseph Barnes, privates.

Those in Captain Cutler's company of Colonel Drury's regiment (term of service, nine months) were: Simeon Howard, sergeant; Jonathan Woods, Jonas Woods, Alpheus Warner, Caleb Sturtevant, Levi Swift, Silas Stone, L. Holyard, Jonathan Warner, Cushman Edson, James Richmond and Joshua Whitcomb, privates.

Those belonging to the Fourth Regiment (enlisted for three years or the war) were: John Woods, corporal; Elias Hall, ensign; Elijah Stone, Fred. Nichols, Jonathan Waite, Caleb Willis, Timothy Stone, Jesse Willis, William Waite, Thomas Dodge, John Dean, Benjamin Lynde, Nehemiah Ward, Ebenezer Ross, Barzillai Thompson, Thomas Gault, Cornelius Cannon, Stephen Witt, Daniel Hunter, Joseph Nye, Fred. M. Callaham, Cornelius Dillins, Henry Gilbert, Elias Parkman, Robert Hoit, James Forbes, Jesse Hoit, Benjamin Chamberlain, Joseph

Blair, Abner Old, Ebenezer Parkman, Arthur Furbush, Joseph Blair, Elijah Commins and Peletiah Hawes, privates.

Those belonging to General Warner's brigade (enlisted for three years or the war) were: John Crosset, Humphrey Willard, Reuben Hoit, Levi Winter, Joseph Hale, J. Ayers, Jr., Jacob Nichols, Timothy Howe, James Weston, Aaron Hall, Zebulon Bassett, Benjamin Witt, Peter Whitcomb, Joseph Shaw, Joseph Willis, Jonathan Weston, John Woods, Josiah Willard, John Ayres, James Bell, Edward Hunter and John Dane, privates.

Other soldiers who enlisted for three years or the war were: Elijah Barnes, John Mathews, Isaiah Bacon, Paul Stewart, Robert Washburn, Peter Adams, Samuel Grainger, John Glass and Elijah Weston, privates; Francis Stone, captain in Gen. Warner's brigade; Wm. Tufts, lieutenant in Captain Knowlton's company in Colonel Dike's regiment; Percy Hall, surgeon's mate in Colonel Learned's regiment; Ephraim Willard, fifer. In the artillery—Daniel Mathews, bombardier; Thomas Mann, gunner. Two others (Firmie Woods and Joseph Pepper) enlisted for eight months in the infantry.

## MILLBURY.

LEONARD DUNNELL GALE.

It is well known that on a return voyage from Havre, in 1832, Professor S. F. B. Morse fell into the company of Dr. Jackson, of Boston, who had been in Europe investigating electro-magnetism and had an electric battery on board.

From conversations at that time Morse claimed that he received a sort of inspiration that instantaneous communication could be made by this means to distant points. Arrived in New York, he proceeded to carry out his inspiration. I will quote his account:

"My means were limited. My first instrument was made up of an old picture or canvas frame, fastened to a table—the wheels of an old wooden clock, three wooden drums, a battery of one cup," and other details.

"I obtained forty feet of wire and found my battery would not work the instrument." This was in 1836.

In the same University of the City of New York, where Morse was professor of art, was a professor of natural sciences, named Gale.

During the three years and more that Morse had been laboring to bring out his inspiration he had kept it a profound secret, but now he felt compelled to seek aid, and knowing that Gale was well informed in electro-magnetism batteries, etc., he invited him to his studio, revealed to him his secret, showed him

the machine that failed to operate, and sought to know the reason.

Gale, who had lately built one for his own use on a newly-invented plan of Professor Henry, of which Morse had never heard, saw at a glance where the defect was. He had it removed to his laboratory, attached to his own battery and proceeded to operate on Morse's forty feet of wire. The electric transit was instantaneous. Additions continued until Gale had ten miles of wire strung up around his laboratory, and the transit seemed as instantaneous as in forty feet.

After the experiments of Gale Morse felt full assurance of success. He petitioned Congress for aid to build a line from Washington to Baltimore.

On March 3, 1843, a bill was carried through appropriating thirty thousand dollars for an experimental line. Gale was employed as electrician and chief engineer to construct the line. He ran it direct from the halls of Congress to the railway station in Baltimore.

Professor Morse fully admitted his obligations to Professor Gale. In a letter to Dr. Jackson, denying any obligation to him, he says: "I have acknowledgments to make to Professor Silliman, but I am most of all indebted to Professor Gale for substantial and effective aid. If any one has a claim to be mutual inventor it is Professor Gale."

He conveyed to Gale a portion of the patent, but purchased it back for fifteen thousand dollars. Professor Gale was through life a devotee to science, and in all the telegraphic experiments, lasting several years, he was more ambitious for its triumph than for fame or fortune. Modest and retiring, he made no effort to bring his name before the public, but was content to remain through life the true friend of Morse, aiding him not only in science, but as an ever reliable witness in court in infringement cases. Morse, in a letter of November 13, 1837, says: "I arrived just in time to see the experiments Gale was making on ten miles of wire, and the result has surprised us all, and I conceive, settles the whole matter." Morse, when reminded of his obligations to Gale, replied: "I might have obtained the information from some one else."

Leonard Dunnell Gale was born in that part of Sutton which is now Millbury, July 25, 1800. He received his primary education from our schools, went hence first to Brown University, then to Union College, where he was graduated in 1825. He received the degree of M.D. from the College of Physicians and Surgeons in New York in 1830. He was professor in the New York College of Pharmacy, professor in Jefferson College, Mississippi, and for a year or two was chemist in the Smithsonian Institute, Washington. He published a work on chemistry and made a survey of Manhattan Island.

The construction of the telegraph brought Gale into prominence and he was called to Washington as

assistant examiner in the Patent Office, and was appointed chief examiner in October, 1846. Washington, in those days, was intensely pro-slavery in sentiment. Professor Gale, being opposed to slavery, brought upon himself the ire of that sentiment. He was plied with threats from high official sources. His reply was worthy the heroic Roman consul Regulus: "I can surrender my office, but not my principles." He was accordingly removed from office October 1, 1857, by order of President James Buchanan, who, as Secretary of State in 1846, had confirmed him in his position. He opened his office as counselor of inventors and patents, and received an extensive and lucrative practice.

He died in Washington, October 22, 1883, leaving a wife and a married daughter. His father, Jonas Gale, lived on the farm which was afterwards sold to Elder Elias Forbe. Three generations of Gales lived on that farm.

#### HOLDEN.

THE DAMON MEMORIAL.<sup>1</sup>—In 1886 it became apparent that a new school-house must be provided to meet the increasing needs of the Centre District, and although the good people have ever manifested a very liberal spirit in educational affairs, like all New Englanders, each citizen had his own peculiar way as to how to meet that need, and a committee was chosen to investigate and report at a future meeting.

Early in their investigations it was rumored that S. C. Gale, Esq., had purchased a building site adjoining the "Common" for a library building, and upon communicating with him his plans were so far outlined as to assure them that it was the intention of himself and wife, a native of Holden, to erect and present to the town a suitable structure to answer for library and high school purposes, to be known as the "Damon Memorial," in memory of Mrs. Gale's brother, the late Rev. Samuel C. Damon, of Honolulu, Sandwich Islands.

The committee's report, with a letter from Mr. Gale, declaring his purposes more minutely, was read in town-meeting and a vote of thanks passed, and from June of 1887 to August, 1888, the beautiful structure arose from foundation to final completion and completeness. In July a committee was chosen to arrange for and have charge of acceptance and dedication of the building, to whom Mr. Gale made known his intention of adding to his already princely gift the sum of three thousand dollars for the purchase of books for a free public library, with instructions to have the books upon the shelves on the day of dedication.

Mr. John Wadsworth, of Chicago, Ill., sent a check for one hundred dollars as a slight recompense to Holden for having furnished him a wife, and the

<sup>1</sup> By W. E. Austin.

Holden Library Association, seeing its great desire of a "Free Public Library" likely to be gratified, voted to close up its affairs and present to the town its library of fourteen hundred volumes and other property.

In September a town-meeting was called for the purpose of formally accepting these various donations and choosing a board of trustees and appropriating necessary funds for current expenses: Trustees, A. K. Learned, W. E. Austin (three years); H. W. Warren, Rev. D. F. Estes (two years); Emory Rogers, Charles E. Parker (one year). The trustees, in grateful recog-

## DOUGLAS.

(List of soldiers, continued from page 1411.)

*Second Massachusetts Heavy Artillery.*—Joseph Bygoine, Charles Bauer, Thomas Fitzgerald, William L. Church, John Hartwell, Miletus Luther, James Clarke (corporal), John Manning, Alfred Snow, Joseph Quinn.

*Sixteenth (Unattached) Company Heavy Artillery.*—Thomas W. Nelson, Byron Richardson, Osborn Richardson.

*First Rhode Island Volunteers.*—George R. Buffum.

*Second Rhode Island Volunteers.*—Leonard C. Belding, Charles W. Stearns.

*Fourth Rhode Island Volunteers.*—Sabine Angell, Windsor Ballou, William W. Caswell, Simeon Smith.

*Seventh Rhode Island Volunteers.*—Elisha E. Thompson (corporal).

THE DAMON MEMORIAL.

niton of the generosity of the donor, voted that the library should ever be known as the "Gale Free Public Library."

The reading-room was opened to the public November 30th, and one week later the library of forty-five hundred carefully selected volumes was ready for the giving out of books—a noble monument to the donors and a potent factor in the future development of our town and the enlightenment and intelligence of our citizens.

"Damonville," page 1390, should read "Dawsonville."

*First Rhode Island Cavalry.*—George Aldrich, Simeon A. Brown, Sylvester Chase, H. C. Fitts (captain), Charles E. Gould, Albert A. Greene, Munroe W. Ide, M. Leech, James Lea, Charles H. Legg, M. M. Luther, William Lyon, Alfred P. Palmer, George Snow, Leander Thompson, Albert J. Watkins, Ira Wakefield, Thomas J. Wood.

*Third Rhode Island Cavalry.*—Charles A. Andrews (quartermaster-sergeant), Edwin F. Andrews (commissary-sergeant), W. D. Balcome, Samuel Cragin, Henry G. Fitts (captain), Daniel E. Gould, Eugene H. Gould, Joseph Hough, Nelson Jepherson (farrier), Thomas Magee (corporal), Myron Simpson, Bennett W. Thomas, Wm. H. Wilcox.

*Seventh Rhode Island Cavalry.*—W. Deforest Balcome, Cyrus Jepherson, George Jepherson, James Jepherson.

*Thirteenth Connecticut Volunteers.*—Newell J. Lee (sergeant).

*Eighteenth Connecticut Volunteers.*—Walter Ward.

*Twenty-sixth Connecticut Volunteers.*—Myron Starrett.

*Engineer Corps United States Army.*—Francis S. Phillips, Napoleon Ritchie.

*Fourth Vermont Volunteers.*—George H. Amidon (captain).

*Signal Corps United States Army.*—Thomas L. Bovey, George Ballou, Addison Hawkey, Henry E. Hawkey, Charles S. Holmes, Michael Martin, John T. Shaw, Horace L. Tilton, Eliot Travis.

*United States Navy.*—Edgar P. Barton, John Norton, James Wilson.

*Veteran Reserve Corps.*—Charles H. Beers, Oscar L. Brown, August Chrome, Edmund Coggeshall, John Goodnow, Dennis M. Hennessey, Munro W. Ide, William F. Krantz, Nathaniel Palmer, James Tubbs, David H. Selgham, Thomas Stratton, Madison Sanborn, Martin H. Schollay.

*ROLL OF HONOR.*—Captain George H. Amidon,<sup>1</sup> Joseph Albee,<sup>1</sup> Captain Simeon Brown,<sup>1</sup> Nathan Bartlett,<sup>1</sup> Daniel A. Burton,<sup>1</sup> Orlando Carpenter,<sup>1</sup> Leonard A. Chapman,<sup>1</sup> Lorin R. Chase,<sup>1</sup> David B. Curtis,<sup>1</sup> Benjamin R. Elliott,<sup>1</sup> Harlan Fairbanks, Captain Henry C. Fitts,<sup>1</sup> John N. Gaskell,<sup>1</sup> Perley U. Germe (missing), George A. Gleason, Henry Glover,<sup>1</sup> Daniel E. Gould,<sup>1</sup> Eugene E. Gould,<sup>1</sup> Charles E. Gould, Albert A. Greene, Allen R. Hough,<sup>1</sup> Joseph Hough, Matthew Hudson,<sup>1</sup> Dr.

Franklin Hunt,<sup>1</sup> George Jepherson,<sup>1</sup> Newell J. Lee (?), M. Leach (missing), Jerrie E. Luther,<sup>1</sup> Abner A. Leland,<sup>1</sup> William Lyon (missing), Timothy Magary,<sup>1</sup> Thomas M. Magee,<sup>1</sup> Mark Mitchell,<sup>1</sup> Daniel Mix, Francis L. Moore,<sup>1</sup> Sylvester Oakes,<sup>1</sup> William Oakes, Nathaniel C. Putnam,<sup>1</sup> Joseph Quinn, Samuel Sibley,<sup>1</sup> George Snow, Myron Starrett,<sup>1</sup> David L. Thomas, Elisha E. Thompson, Leander Thompson,<sup>1</sup> Luther White,<sup>1</sup> William H. Wilcox.<sup>1</sup>
